Code Generation

in Simulink J. Grant, 2018-03-08 Generating code from MATLAB algorithms for desktop and embedded systems allows you to perform your software design implementation and testing completely within the MATLAB workspace You can Verify that your algorithms are suitable for code generation Generate efficient readable and compact C C code automatically which eliminates the need to manually translate your MATLAB algorithms and minimizes the risk of introducing errors in the code Modify your design in MATLAB code to take into account the specific requirements of desktop and embedded applications such as data type management memory use and speed Test the generated code and easily verify that your modified algorithms are functionally equivalent to your original MATLAB algorithms Generate MEX functions to accelerate MATLAB algorithms in certain applications and speed up fixed point MATLAB code and Generate hardware description language HDL from MATLAB code To convert MATLAB code to efficient C C code the code generator introduces optimizations that intentionally cause the generated code to behave differently and sometimes produce different results than the original source code In the MATLAB language variables can change their properties dynamically at run time so you can use the same variable to hold a value of any class size or complexity However statically typed languages like C must be able to determine variable properties at compile time Therefore for C C code generation you must explicitly define the class size and complexity of variables in MATLAB source code before using them For C C code generation you should explicitly and unambiguously define the class size and complexity of variables before using them in operations or returning them as outputs Define variables by assignment but note that the assignment copies not only the value but also the size class and complexity represented by that value to the new variable When generating C C code from MATLAB you cannot grow a variable by writing into an element beyond its current size Such indexing operations produce run time errors You must define the matrix first before assigning values to its elements During C C code generation the code generator checks for statements that attempt to access uninitialized memory If it detects execution paths where a variable is used but is potentially not defined it generates a compile time error To prevent these errors define variables by assignment before using them in operations or returning them as function outputs Note however that variable assignments not only copy the properties of the assigned data to the new variable but also initialize the new variable to the assigned value This forced initialization sometimes results in redundant copies in C C code You can reuse reassign an input output or local variable with different class size or complexity if the code generator can unambiguously determine the properties of each occurrence of this variable during C C code generation If so MATLAB creates separate uniquely named local variables in the generated code You can view these renamed variables in the code generation report You cannot reuse reassign variables if it is not possible to determine the class size and complexity of an occurrence of a variable unambiguously during code generation In this case variables cannot be renamed and a compilation error occurs Aerospace Engineering ,1992 *Automotive Engineering* ,1992-07
