Weick,1953 Flight tests were made with a typical light airplane to investigate possibilities for obtaining reliable control at low flight speeds It was found that satisfactory lateral control occurred consistently even under conditions simulating extremely gusty air at angles of attack approximately 2 degrees below that for the maximum lift coefficient or the stall of the wing as a whole This 2 degree margine was substantially the same both with full power and with the engine throttled and throughout the range of center of gravity locations tested Supplementary tests were then made on the control at high angles of attack under actual gusty air conditions on the possibility of entering spins and on the amount of elevator control required for normal three point landings It was found that with the original plain untwisted wing obtaining the constant 2 degree margin below the stall required widely different elevator deflections for the range of power and center of gravity locations tested Also none of these settings ws high enough to produce a three point landing      **Encyclopedia of Instrumentation for Industrial Hygiene** University of Michigan.
