**Magnesium Injection Molding** Frank Czerwinski, 2007-12-07  
 The continuous quest for weight reduction especially in ground and air transportation has catalyzed the development of light metals and alloys  
 In this search particular attention is being paid to magnesium used at present in a diversity of applications each one exploring a specific range of unique properties  
 As a result the magnesium consumption by many important market sectors is growing at an impressive rate exceeding 10% per year  
 In parallel with the alloy development the search continues for new techniques of converting magnesium into useful products in a safe and effective manner  
 Magnesium injection molding commercialized in recent years represents a modern technology that is clean and safe for workers as well as friendly for an environment  
 Extensive research conducted at both the industrial and university levels indicates that the technique exceeded its initial expectations  
 While combining key features of a number of processing techniques magnesium injection molding is emerging as a universal technology capable of implementing many conventional and novel processing routes  
 The routes are based on both the semisolid slurry and fully molten alloy with tightly controlled temperature  
 Despite well advanced practice the critical breakthrough is still hindered by slow progress in understanding key mechanisms controlling the process at stages of slurry preparation and component forming
