British Library. Lending Division, 1987 **Blasting Hazards of Gold Mining in Sulfide-bearing Ore Bodies** Yael
Miron, 1992 Two recent unplanned detonations occurred during blasting operations in sulfide bearing ores in a Nevada gold
mine Other premature detonations have also reportedly occurred at other Nevada California and Arizona operations within
the past few years with increasing frequency Unplanned or premature detonations can be extremely hazardous to life and
can cause extensive property damage A miner was injured in one of these occurrences This report by the U S Bureau of
Mines intended to acquaint personnel involved in such mining activities with the basic causes for these accidents These
causes include the exothermic oxidation of pyrite FeS_2 and formation of ferrous sulfate FeSO_4 the exothermic and energetic
reaction of the ferrous sulfate with ammonium nitrate fuel oil ANFO based explosives and the associated elevated
temperatures that can set off detonators and explosives in the boreholes Recommendations for safe operation by the Mine
Safety and Health Administration the Bureau and the mine involved with the recent incidents include monitoring
temperatures in the blast holes analyzing for sulfate and ferrous ions and limiting the time between loading and firing in
accordance with conditions in the blast holes Other procedures for safe operations should fit specific conditions in the mines
