**Food Borne Pathogens and Antibiotic Resistance** Om V. Singh, 2017-01-30 Food is an essential means for humans and other animals to acquire the necessary elements needed for survival. However, it is also a transport vehicle for foodborne pathogens which can pose great threats to human health. Use of antibiotics has been enhanced in the human health system; however, selective pressure among bacteria allows the development of antibiotic resistance. Foodborne Pathogens and Antibiotic Resistance bridges technological gaps focusing on critical aspects of foodborne pathogen detection and mechanisms regulating antibiotic resistance that are relevant to human health and foodborne illnesses. This groundbreaking guide introduces the microbial presence on a variety of food items for human and animal consumption. It provides the detection strategies to screen and identify the variety of food pathogens in addition to reviewing the literature. It provides the microbial molecular mechanism of food spoilage along with the molecular mechanism of microorganisms acquiring antibiotic resistance in food. It discusses the systems biology of food-borne pathogens in terms of detection and food spoilage. It discusses FDA's regulations and Hazard Analysis and Critical Control Point (HACCP) towards challenges and possibilities of developing global food safety. Foodborne Pathogens and Antibiotic Resistance is an immensely useful resource for graduate students and researchers in the food science, food microbiology, microbiology, and industrial biotechnology.
