SHORT ANSWER Answer the following questions in the space provided.

1. Name the type of energy that is a measure of strength for each of the following types of bonds:

_____ a. ionic bond
_____ b. covalent bond
_____ c. metallic bond

2. Use the electronegativity values shown in Figure 5-20, on page 151 of the text, to determine whether each of the following bonds is nonpolar covalent, polar covalent, or ionic.

_____ a. H—F	_____ d. H—H
_____ b. Na—Cl	_____ e. H—C
_____ c. H—O	_____ f. H—N

3. How is a hydrogen bond different from an ionic or covalent bond?

4. H_2S and H_2O have similar structures and their central atoms belong to the same group. Yet H_2S is a gas at room temperature and H_2O is a liquid. Use bonding principles to explain why this is true.

Modern Chemistry Chapter 6 Review:

Modern Chemistry Holt Rinehart & Winston, Holt, Rinehart and Winston Staff, 2001 Modern Chemistry Nicholas D. Tzimopoulos, 1993 **Modern Methods of Geochemical Analysis** Richard Wainerdi, 2012-12-06

The founders of geology at the beginning of the last century were suspicious of laboratories. Hutton's well known dictum illustrates the point. There are also superficial reasoning men they judge of the great operations of the mineral kingdom from having kindled a fire and looked into the bottom of a little crucible. The idea was not unreasonable the earth is so large and its changes are so slow and so complicated that laboratory tests and experiments were of little help. The earth had to be studied in its own terms and geology grew up as a separate science and not as a branch of physics or chemistry. Its practitioners were for the most part experts in structure stratigraphy or paleontology not in silicate chemistry or mechanics. The chemists broke into this closed circle before the physicists did. The problems of the classification of rocks particularly igneous rocks and of the nature and genesis of ores are obviously chemical and by the mid 19th century chemistry was in a state where rocks could be effectively analyzed and a classification built up depending partly on chemistry and partly on the optical study of thin specimens. Gradually the chemical study of rocks became one of the central themes of earth science.

Independent and Weekly Review, 1914 Fourier Transforms in NMR, Optical, and Mass Spectrometry A.G. Marshall, F.R. Verdun, 2016-02-25

Written by spectroscopists for spectroscopists here is a book which is not only a valuable handbook and reference work but also an ideal teaching text for Fourier transform methods as they are applied in spectroscopy. It offers the first unified treatment of the three most popular types of FT spectroscopy with uniform notation and complete indexing of specialized terms. All mathematics is self contained and requires only a knowledge of simple calculus. The main emphasis is on pictures and physical analogs rather than detailed algebra. Instructive problems presented at the end of each chapter offer extensions of the basic treatment. Solutions are given or outlined for all problems. The book offers a wealth of practical information to spectroscopists. Non ideal effects are treated in detail: noise source and detector limited non linear response limits to spectrometer performance based on finite detection period finite data size mis phasing etc. Common puzzles and paradoxes are explained e.g. use of mathematically complex variables to represent physically real quantities interpretation of negative frequency signals on resonance vs off resonance response interpolation when it helps and when it doesn't ultimate accuracy of the data differences between linearly and circularly polarized radiation multiplex advantage or disadvantage etc. Chapter 1 introduces the fundamental line shapes encountered in spectroscopy from a simple classical mass on a spring model. The Fourier transform relationship between the time domain response to a sudden impulse and the steady state frequency domain response absorption and dispersion spectra to a continuous oscillation is established and illustrated. Chapters 2 and 3 summarize the basic mathematics definitions formulas theorems and examples for continuous analog and discrete digital Fourier transforms and their practical implications. Experimental aspects which are common to the signal Chapter 4 and

noise Chapter 5 in all forms of Fourier transform spectrometry are followed by separate chapters for treatment of those features which are unique to FT MS FT optical FT NMR and other types of FT spectroscopy The list of references includes both historical and comprehensive reviews and monographs along with articles describing several key developments The appendices provide instant access to FT integrals and fast algorithms as well as a pictorial library of common Fourier transform function pairs The comprehensive index is designed to enable the reader to locate particular key words including those with more than one name
