

Chapter 10: Molecular Biology of the Gene

The Structure of the Genetic Material

-early in the 20th century, the molecular basis for inheritance was a mystery

-in 1928, Frederick Griffith was surprised to find that when he killed pathogenic bacteria, then mixed the bacterial remains with living harmless bacteria

- Some living bacterial cells became pathogenic and
- All of the descendants of the transformed bacteria inherited the newly acquired ability to cause disease

-by carefully choosing their model organism, Hershey and Chase were able to show that certain **phages** (bacterial viruses) reprogram host cells to produce more phages by injecting their DNA

-DNA and RNA are nucleic acids consisting of long chains (polymers) of chemical units (monomers) called **nucleotides**

-one of the two strands of DNA is a DNA **polynucleotide**, a nucleotide polymer (chain)

-a nucleotide is composed of a

- Nitrogenous base
- 5 carbon sugar, and
- Phosphate group

-the nucleotides are joined to one another by a **sugar-phosphate background**

-each type of DNA nucleotide has a different nitrogen-containing base: **adenine (A), cytosine (C), thymine (T), and guanine (G)**
