

## Chapter 6 | Cell Cycle and Mitosis

### CELL CYCLE

- The sequence of events from the time a cell first arises as a result of cell division until the time when that cell itself divides.
- The cell cycle consists of four phases: G1, S, G2, M
- It consists of periods of: Growth and Development, DNA Replication, Preparation for Division, Cell Division

### RNA SYNTHESIS

- Is necessary in order to code for progression through all cell cycle phases.
- In prokaryotic cells, transcription (DNA to mRNA) and translation (mRNA to protein) are so closely linked that translation usually begins before transcription is complete. In eukaryotic cells, however, the two processes are separated in both space and time:

mRNA is synthesized in the nucleus, and

protein synthesis occurs in the cytoplasm.

#### Transcription

- The process of copying a segment of DNA into RNA.
- In eukaryotes, this occurs in the nucleus.
- The DNA double helix is unwound, and one strand is used as a template to synthesize a complementary RNA strand.

#### Translation

- The process of synthesizing a protein from an mRNA template.
- Occurs in the cytoplasm.
- The mRNA is read in codons (groups of three bases), and each codon specifies a particular amino acid.
- Ribosomes facilitate the assembly of amino acids into a polypeptide chain.

### MITOSIS

- is a type of cell division in which the nucleus of the cell divides into two nuclei with identical genetic material. The resulting two daughter cells have the same number of chromosomes similar to the parent cell; thus, a diploid parent cell containing two sets of chromosomes (paternal and maternal chromosome sets) will result into two diploid daughter cells after mitosis.
- occurs only in somatic (body) cells of eukaryotes. It is used by multicellular organisms for growth and development, repair of tissues, and in asexual reproduction.
- is the process in which a eukaryotic cell nucleus splits in two, followed by the division of the parent cell into two daughter cells.
- is a continuous process but it is traditionally divided into five stages:

#### Stages of Mitosis

1. Prophase: The nuclear envelope breaks down, and the chromatin condenses into visible chromosomes.
2. Metaphase: The chromosomes align at the metaphase plate (equator) of the cell.
3. Anaphase: The sister chromatids separate and move toward opposite poles of the cell.
4. Telophase: The nuclear envelope reforms around the two sets of chromosomes.
5. Cytokinesis: The cytoplasm divides, resulting in two daughter cells.
