

A detailed microscopic image of a neuron, likely a multipolar neuron, is the central focus. The cell body (soma) is a large, irregularly shaped structure with a reddish-pink hue, showing internal organelles. Numerous long, thin, branching processes (dendrites and an axon) extend from the cell body, colored in shades of green and yellow. These processes are set against a dark, almost black background, which makes the neuron stand out. The overall composition is artistic and scientific, typical of a textbook cover.

Molecular And Cellular Physiology Of Neurons Second Edition:

Molecular and Cellular Physiology of Neurons Gordon L. Fain, 1999 This book provides a comprehensive and up to date account of what we now know and what we want to know and can reasonably expect to discover in the near future about the functioning of the brain at the level of molecules and cells It takes readers from the fundamentals to the most sophisticated concepts and latest discoveries from membrane potentials to recent experiments on voltage gated ion channels from descriptions of receptors G proteins effector molecules and secondary messengers to an account of our current understanding of long term potentiation

Sensory Transduction Gordon L. Fain, 2019-10-17 How are sights and sounds and smells converted into electrical signals in a form that can be interpreted by the nervous system Although this process called sensory transduction began to be understood only relatively recently so much progress has been made that it is now possible to say at least in outline but in most cases in remarkable detail how transduction occurs for all of the major sense organs of the body Since the first edition was published in 2003 many new experiments have radically changed some of our previously held views This new edition fulfils the book s original aims both as an accessible textbook and a general introduction to the senses by bringing the contents fully up to date with the new information acquired over the last 15 years In so doing it continues to provide a comprehensive survey of one of the greatest achievements of modern biology and neuroscience the unravelling of the mechanism of sensation

Sensory Transduction is written for advanced undergraduates graduate students and researchers in neurophysiology and sensory neuroscience It is also of relevance and use to a broader audience of neuro evolutionary integrative and comparative biologists

The Neuronal Functions of EF-hand Ca(2+)-binding Proteins 2nd Edition Michael R. Kreutz, José R. Naranjo, Karl-Wilhelm Koch, Beat Schwaller, 2016-11-01 Ca²⁺ signaling in neurons is characterized by highly restricted and dynamic gradients called Ca²⁺ waves spikes transients and puffs depending upon their corresponding spatial and temporal features Based on this strict segmentation the Ca²⁺ ion provides a versatile basis for complex signaling in neuronal subcompartments with a spatial resolution of micro and nanodomains The multitude of Ca²⁺ regulated processes requires specialized downstream processing machinery translating the Ca²⁺ signal into alterations of cellular processes The broad range of different Ca²⁺ triggered phenomena in neurons ranging from neurotransmission to gene expression is reflected by the existence of a multitude of different Ca²⁺ binding proteins CaBPs from which numerous belong to the EF hand super family EF hand proteins can be subdivided into Ca²⁺ buffer and Ca²⁺ sensor proteins Whereas the first group has a very high affinity for Ca²⁺ exhibits little conformational change in the Ca²⁺ bound state and is thought to mainly chelate Ca²⁺ the second group has a lower affinity for Ca²⁺ and shows considerable conformational changes upon Ca²⁺ binding which usually triggers a target interaction Neuronal calcium sensor NCS proteins and the related Caldendrin CaBP Calneuron nCaBPs proteins are members of this latter group They resemble the structure of their common ancestor Calmodulin CaM with four EF hand Ca²⁺ binding motifs of which not all are functional However despite their structural

homology with CaM NCS as well as nCaBPs are quite diverse in amino acid sequence. It is therefore surprising that relatively few binding partners have been identified that are not CaM targets and this raises the question of the specificity and function of these interactions. In terms of function, binding of NCS and nCaBP has frequently different consequences than binding of CaM which substantially increases the versatility of the Ca²⁺ tool kit. The general idea of this special issue is to provide an overview on the function of neuronal EF hand calcium binding proteins in health and disease. But we will not just provide a mere collection of articles to stress the function of each protein. The issue will mainly deal with emerging concepts on Ca²⁺ signaling buffering mediated by EF hand Ca²⁺ binding proteins. This includes questions like features that define the functional role of a EF hand calcium sensor in neurons, the conditions that make physiological relevance of a given interaction of a CaBP with its target plausible, the emerging synaptic role of these proteins and mounting evidence for their role in the regulation of protein trafficking. Structural aspects and biophysical studies will be covered. Another aspect will be the role of CaBPs in brain disease states. This aspect includes studies showing that CaBPs are targets of drugs in clinical use, studies showing that expression levels of calcium binding proteins are frequently altered in brain disease states as well as reports on mutations in EF hand calcium sensors linked to human disease.
