

## Cell Size

What determines the size of a cell?

**Why?**

Sometimes bigger is better—tall basketball players, more closet space, and savings accounts may come to mind. What about cells? Does having big cells make an organism bigger or better? Would having larger cells be an advantage to an organism? If so, why do cells divide rather than continue growing? Maybe there is an advantage to being small.

### Model 1 – Investigating Cell Size

1. Are the cells shown in Model 1 plant or animal cells? Explain your answer.  
**ANIMAL – NO CELL WALL, CHLOROPLAST, LARGE CENTRAL VACUOLE**

2. Label Cell B in Model 1 with the following structures.

cell membrane

cytoplasm

nucleus

ribosomes

vacuole

mitochondria

3. Compare the smaller cell in Model 1 to the larger cell in Model 1.

a. Which cell has a larger surface area (more cell membrane surface)?

**CELL B (LARGER CELL) HAS A LARGER SURFACE AREA THAN CELL A.**

b. Which cell has more channels in its cell membrane that can transport molecules (nutrients, oxygen, and waste products) in and out of the cell?

**CELL B (LARGER CELL) HAS MORE CELL MEMBRANE CHANNELS THAN CELL A.**

**Investigating Cellular Nanoscale with X-rays** Clément Hémonnot, 2016 The advances and technical improvements of X ray imaging techniques taking advantage of X ray focussing optics and high intensity synchrotron sources nowadays allow for the use of X rays to probe the cellular nanoscale Importantly X rays permit thick samples to be imaged without sectioning or slicing In this work two macromolecules namely keratin intermediate filament IF proteins and DNA both essential components of cells were studied by X ray techniques Keratin IF proteins make up an integral part of the cytoskeleton of epithelial cells and form a dense intracellular network of bundles This network is built from monomers in a hierarchical fashion Thus the keratin structure formation spans a large range of length scales from a few nanometres monomers to micrometres networks Here keratin was studied at three different scales i filaments ii bundles and iii networks Solution small angle X ray scattering revealed distinct structural and organisational characteristics of these highly charged polyelectrolyte filaments such as increasing radius with increasing salt concentration and spatial accumulation of ions depending on the salt concentration The results are quantified by employing advanced modelling of keratin IFs by a core cylinder flanked with Gaussian chains Scanning micro diffraction was used to study keratin at the bundle scale Very different morphologies of keratin bundles were observed at different salt conditions At the network scale new imaging approaches and analyses were applied to the study of whole cells Ptychography and scanning X ray nano diffraction imaging were performed on the same cells allowing for high resolution in real and reciprocal space thereby revealing the internal structure of these networks By using a fitting routine based on simulations of IFs packed on a hexagonal lattice the radius of each filament and distance between filaments were retrieved In mammalian cells each nucleus contains 2 nm thick DNA double helices with a total length of about 2 m The DNA strands are packed in a highly hierarchical manner into individual chromosomes DNA was studied in intact cells by visible light microscopy and scanning X ray nano diffraction unveiling the compaction and decompaction of DNA during the cell cycle Thus we obtained information on the aggregation state of the nuclear DNA at a real space resolution on the order of few hundreds nm To exploit to the reciprocal space information individual diffraction patterns were analysed according to a generalised Porod's law at a resolution down to 10 nm We were able to distinguish nucleoli heterochromatin and euchromatin in the nuclei and follow the compaction and decompaction during the cell division cycle

Programmed Cell Death which was held in the Shanghai Science Center of the Chinese Academy of Sciences on September 8 12 1996 Apoptosis has attracted great attention in the past several years This is reflected in part by the exponential increase in the number of papers published on the subject While several major scientific conferences have been held in recent years this meeting represents the first major international scientific meeting on programmed cell death held in Asia where fast economic growth promises a bright future for both basic and applied research in biomedical sciences We organized the meeting with the belief that such a gathering would foster a closer interaction between scientists from the West and those in Asia Research on programmed cell death has expanded so extensively that no one meeting can cover all the important subjects related to apoptosis The Shanghai meeting focused on several key areas ranging from well established ones such as cell death in the immune system to emerging ones such as the role of ECM in regulating cell fate Specifically the subjects presented and discussed included programmed cell death during development the regulation and biochemical mechanisms of lymphocyte apoptosis the involvement of extracellular matrix and its remodeling in programmed cell death genes that cause or prevent cell death and the application of apoptosis toward cancer therapy Cancer Models Michael

Breitenbach, Jens Hoffmann, 2019-02-05 Cancer research like research on other diseases highly depends on representative and reliable model systems In the Research Topic Cancer Models we collected original papers and review articles addressing the topic of tumor modeling from molecular biology biochemistry microorganisms cells and organoids fishes animals and xenografts up to computational cancer models and patient data analysis This representative eBook describes that there is not a single molecular defined tumor but rather a heterogenic and highly variable complex of different individual diseases This is what makes research on cancer so difficult expensive and explains the broad number of models needed for research Our authors describe new next generation sequencing based methods to analyze complex patterns of chromosomal aberrations in order to understand the molecular biology of tumorigenesis as well as the role of cellular senescence and dormancy in the aetiology of tumor formation and development of therapy resistance of tumors The current developments on 3D cultures are thoroughly reviewed as these models help to overcome the current limitations of cell cultures and allow a more accurate mimicry of the native cancer tissue including cellular heterogeneity and restore specific biochemical and morphological Reviews about tumor models in zebrafish different transgenic mouse strains and pigs conclude the book In the final two chapters of this volume the authors discuss the theoretical and mathematical models developed in cancer research
