Search Techniques in Intelligent Classification Systems Andrey V. Savchenko, 2016-05-02 A unified methodology for categorizing various complex objects is presented in this book Through probability theory novel asymptotically minimax criteria suitable for practical applications in imaging and data analysis are examined including the special cases such as the Jensen Shannon divergence and the probabilistic neural network An optimal approximate nearest neighbor search algorithm which allows faster classification of databases is featured Rough set theory sequential analysis and granular computing are used to improve performance of the hierarchical classifiers Practical examples in face identification including deep neural

networks isolated commands recognition in voice control system and classification of visemes captured by the Kinect depth camera are included This approach creates fast and accurate search procedures by using exact probability densities of applied dissimilarity measures This book can be used as a guide for independent study and as supplementary material for a technically oriented graduate course in intelligent systems and data mining Students and researchers interested in the theoretical and practical aspects of intelligent classification systems will find answers to Why conventional implementation of the naive Bayesian approach does not work well in image classification How to deal with insufficient performance of hierarchical classification systems Is it possible to prevent an exhaustive search of the nearest neighbor in a database

Detection and Recognition Asit Kumar Datta, Madhura Datta, Pradipta Kumar Banerjee, 2015-08-26 Face detection and recognition are the nonintrusive biometrics of choice in many security applications. Examples of their use include border control, driver's license issuance, law enforcement investigations, and physical access control. *Face Detection and Recognition: Theory and Practice* elaborates on and explains the theory and practice of face detection and recognition systems currently in vogue. The book begins with an introduction to the state of the art, offering a general review of the available methods and an indication of future research using cognitive neurophysiology. The text then explores subspace methods for dimensionality reduction in face image processing, statistical methods applied to face detection, and intelligent face detection methods dominated by the use of artificial neural networks. It covers face detection with colour and infrared face images, face detection in real time, face detection and recognition using set estimation theory, face recognition using evolutionary algorithms, and face recognition in frequency domain. It discusses methods for the localization of face landmarks helpful in face recognition, methods of generating synthetic face images using set estimation theory, and databases of face images available for testing and training systems. Features pictorial descriptions of every algorithm as well as downloadable source code in MATLAB, PYTHON, and hardware implementation strategies with code examples. Demonstrates how frequency domain correlation techniques can be used, supplying exhaustive test results. *Face Detection and Recognition: Theory and Practice* provides students, researchers, and practitioners with a single source for cutting edge information on the major approaches, algorithms, and technologies used in automated face detection and recognition. Here we propose a local variation detection and restoration method based on the two dimensional 2D principal component analysis (PCA). The depth map of a 3D facial image is first smoothed using median filter to minimize the local variation. The detected face shape is cropped, normalized to a standard image size of 101x101 pixels, and the forefront nose point is selected to be the image center. Facial depth values are scaled between 0 and 255 for translation and scaling invariant identification. The preprocessed face image is smoothed to minimize the local variations. The 2DPCA is applied to the resultant range data, and the corresponding principal or eigen images are used as the characteristic feature vectors of the subject to find his/her identity in the database of pre-recorded faces. The system's performance is tested against the GavabDB facial databases. Experimental results show that the proposed method is able to identify subjects with

different gesture and mimics in the presence of noise in their 3D facial images Implementing Face Recognition in MATLAB: Beginners Edition Manisha Omprakash Sharma Msc, 2018-08-04 Face recognition is an application of computer science based Image processing This is a small book written about Face Recognition technology and its applications in the field of Computer Science Book includes general information about the implementation of Face recognition using MATLAB computing environment It also includes information about some data sets that can be used and different approaches to solve the problem This short book also contains a comparative study of some prominently known subspace analysis methods or techniques that can be applied to achieve Face recognition using computer science **Face Recognition System** Muhamad Azahar Jaafar, 2011
