H Shanley (Jr),NAVAL RESEARCH LAB WASHINGTON DC.,1990 A series of tests was conducted to evaluate the effectiveness of Aqueous Film Forming Foam AFFF potassium bicarbonate powder PKP and Halon 1211 alone and in various combinations in extinguishing spray fires The sprays were generated by JP 5 jet fuel issuing from an open sounding tube and open petcock a leaking flange or a slit pipe and contacting an ignition source The results indicate that typical fuel spray fires such as those simulated in this series are very severe Flame heights ranged from 6 1 m 20 ft for the split pipe to 15 2 m 50 ft for the sounding tube scenario These large flame geometries were accompanied by heat release rates of 6 MW to greater than 50 MW and hazardous thermal radiation levels in the near field

environment up to 9.1 m (30 ft) away. Successful suppression of these fires requires both a significant reduction in flame radiation and delivery of a suppression agent to shielded areas. Of the nine suppression methods tested, the 95 gpm AFFF hand line and the hand line in conjunction with PKP were particularly effective in reducing the radiant flux. Keywords: Jet engine fuels, Fire extinguishing agents, Halon, Fuel oil fires, Thermal radiation, etc.
