

Parts of an overhead crane

Cranes lift and lower loads with a hoist that is attached to a trolley. The trolley moves back and forth along a bridge. The bridge moves along a runway. Some cranes - such as a jib crane - don't have a bridge but still have a hoist attached to a trolley and can move a load in a horizontal direction.

A bridge crane is defined as a crane, fixed or able to move along track(s) having at least one primary horizontal girder and equipped with at least one hoisting mechanism. There are four main types of overhead cranes: top running, under running, single girder and double girder.

Types of overhead cranes

Single girder - The hoist travels along the bottom of the crane girder in both the running and standing configurations.

Double girder - Usually, other crane types require that single girder bridges, as the hoist can be mounted on top of the bridge rather than underneath.
