

- Infusion rate (or use of the infusion rate table) should be specified by the HHA/HP after patient assessment.
- **Maximum** infusion rates at specific intervals **should not be exceeded**.
- Monitor infusion with desired rate-related symptoms such as headache, arm/leg pain and BP changes.
- Advise the patient with death rate change. Nursing staff may revert to a previously tolerated rate if the patient demonstrates symptoms. If symptoms resolve with rate decrease, a transfusion reaction investigation is not required.

- High infusion rates **should not** be used for patients at risk for renal impairment, elderly patients, or those with a history of hypertension, cardiovascular disease, previous thrombotic events or dehydration as they are at increased risk of thrombus formation.

Flow calculation: Rate (mL/hr) = PB Weight (kg) x Desired Rate (mL/kg/hr) = mL/hr

PB Weight (kg)	Infusion Rate	Flow	Flow	Flow MAXIMUM rate is: • 100% (100%) maximum • Must meet or exceed desired rate (100% maximum) • Different PBW based than last (100% maximum) • Patients with renal impairment, risk of thrombus or > 60 years	Flow Only if necessary or 100% (100%)	Flow MAXIMUM rate is: • Less than 100% maximum • Only if necessary for 100% (100%)
	0.1 mL/kg/hr @ 10 min	0.2 mL/kg/hr @ 10 min	0.3 mL/kg/hr @ 10 min	0.1 mL/kg/hr** for remainder of infusion	0.1 mL/kg/hr @ 10 min	0.1 mL/kg/hr** for remainder of infusion

IVIG Therapy
Today Mark Ballow, 2012-12-06 It has been little more than a century since Emil von Behring and his colleagues 1890 showed that the blood of tetanus immune rabbits contained a factor that could be transferred to nonimmune animals to protect them against tetanus These observations together with the work of Paul Ehrlich started scientists on the long and complex path to our present understanding of the humoral or B cell immune system These early studies led to Nobel prize awards for von Behring 1901 and Ehrlich 1908 each of whom contributed much to our knowledge of the B cell immune system In the early 20th century it was recognized that the serum of individuals who had recently suffered an infection contained a protective humoral factor that could be transferred to a nonimmune person thereafter affording that individual protection against the infectious agent that had caused disease In 1933 McKhann and Chu reported that a placental extract containing the globulin fraction could modify measles However it was not until 1939 that Tiselius and Kabat demonstrated that the antibodies responsible for protection against these infectious disorders resided within the gammaglobulin plasma fraction In a major step forward Cohn in 1944 established a method for the fractionation and purification of this plasma gammaglobulin fraction These procedures which are based on cold ethanol precipitation of plasma produce a readily adaptable large scale fractionation procedure that is still utilized to this day in the preparation of commercial gammaglobulin
