#### 1.1 Important Definitions and Notes for Limits

##### ➤ Important notations:

- If a value  $x$  gets closer and closer to another value  $a$  then we can symbolise this the following way:
  - $x \rightarrow a$ , which states that  $x$  tends towards  $a$  (i.e.  $x$  gets closer and closer to  $a$ ).
- Using the above point, we can also state that a function tends towards a specific value:
  - $f(x) \rightarrow b$ , in this case, the function  $f(x)$  tends towards the value  $b$  (i.e.  $f(x)$  gets closer and closer to  $b$ ).
- By combining these two notations we can state the following:
  - If  $x \rightarrow a$  then  $f(x) \rightarrow b$
  - This statement states that as the value of  $x$  tends towards  $a$  the function  $f(x)$  tends towards  $b$ .
- This is where limits come in, we re-write the statement above as:

$$\lim_{x \rightarrow a} f(x) = b$$

- It states that the limit of a function is the value  $b$  as  $x$  gets closer and closer to  $a$ .
- If  $f(x)$  does not tend to any particular real number (including  $\infty$  and  $-\infty$ ) then we say that the limit for the function  $f(x)$  does not exist when  $x \rightarrow a$ .
- We assume that limits follow the basic rules and order of solving just like algebraic expressions (BODMAS, BEDMAS etc.).

#### 1.2 Important Factorisation Principles for Solving Limits

- $(b - a) = -(a - b)$
- Difference of two squares:  $a^2 - b^2 = (a + b)(a - b)$
- Squaring a difference bracket:  $(a - b)^2 = a^2 - 2ab + b^2$
- Squaring a sum bracket:  $(a + b)^2 = a^2 + 2ab + b^2$

String-Math 2013 Ron Donagi, Michael R. Douglas, Ljudmila Kamenova, Martin Rocek, 2014-12-02 This volume contains the proceedings of the conference String Math 2013 which was held June 17-21, 2013 at the Simons Center for Geometry and Physics at Stony Brook University. This was the third in a series of annual meetings devoted to the interface of mathematics and string theory. Topics include the latest developments in supersymmetric and topological field theory, localization techniques, the mathematics of quantum field theory, superstring compactification and duality, scattering amplitudes and their relation to Hodge theory, mirror symmetry and two-dimensional conformal field theory, and many more. This book will be important reading for researchers and students in the area and for all mathematicians and string theorists who want to update themselves on developments in the math-string interface.

Quantum Symmetries Thomas Creutzig, Julia Plavnik, David Ridout, 2025-03-19 This volume contains the proceedings of the thematic program on Quantum symmetries, Tensor categories, topological quantum field theories and vertex algebras held from October 10 to November 4, 2022 at the Centre de Recherches Mathématiques, Montréal, Québec, Canada. Quantum symmetries is a rapidly expanding area in which tensor categories are applied to mathematical physics, in particular to conformal and topological quantum field theories. These fields in turn connect to a huge variety of modern mathematics, including representation theory, vertex operator algebras, Hopf algebras, link and knot invariants, geometry, subfactors, combinatorics, and so much more. The thematic program on quantum symmetries featured advanced lecture courses and research seminars by international leaders of their respective fields. This proceedings volume is centered on the active research of the area but also includes an in-depth survey of one of the main topics: W-algebras.

Bailey, Jonathan M. Borwein, 2016-07-19 This book contains a compendium of 25 papers published since the 1970s dealing with pi and associated topics of mathematics and computer science The collection begins with a Foreword by Bruce Berndt Each contribution is preceded by a brief summary of its content as well as a short key word list indicating how the content relates to others in the collection The volume includes articles on actual computations of pi articles on mathematical questions related to pi e.g. Is pi normal articles presenting new and often amazing techniques for computing digits of pi e.g. the BBP algorithm for pi which permits one to compute an arbitrary binary digit of pi without needing to compute any of the digits that came before papers presenting important fundamental mathematical results relating to pi and papers presenting new high tech techniques for analyzing pi i.e. new graphical techniques that permit one to visually see if pi and other numbers are normal This volume is a companion to Pi A Source Book whose third edition released in 2004 The present collection begins with 2 papers from 1976 published by Eugene Salamin and Richard Brent which describe quadratically convergent algorithms for pi and other basic mathematical functions derived from some mathematical work of Gauss Bailey and Borwein hold that these two papers constitute the beginning of the modern era of computational mathematics This time period 1970s also corresponds with the introduction of high performance computer systems supercomputers which since that time have increased relentlessly in power by approximately a factor of 100 000 000 advancing roughly at the same rate as Moore's Law of semiconductor technology This book may be of interest to a wide range of mathematical readers some
