Use the RDW process to solve. Use a letter to represent the unknown in each problem.

1. A box containing 3 small bags of flour weighs 950 grams. Each bag of flour weighs 300 grams. How much does the empty box weigh?

$$300 + 300 + 300 = 900$$

$$950 - 900 = 50 \text{ g}$$

The empty box weighs 50 grams.

2. Mr. Cullen needs 91 carpet squares. He has 49 carpet squares. If the squares are sold in boxes of 6, how many more boxes of carpet squares does Mr. Cullen need to buy?

$$\begin{array}{r} 91 \\ - 49 \\ \hline 42 \end{array}$$

$$42 \div 6 = 7$$

Mr. Cullen needs to buy 7 more boxes.

3. Erica makes a banner using 4 sheets of paper. Each paper measures 9 inches by 10 inches. What is the total area of Erica's banner?

$$A = 9 \times 40$$

$$A = 360 \text{ sq. in.}$$

The total area is 360 sq in

Evaluation and Extension of Mathematical Models of P2P Systems Inna Kotchourova, 2008-03-11 Master's Thesis from the year 2007 in the subject Computer Science General grade 1 3 Technical University of Darmstadt language English abstract In this thesis existing mathematical models for P2P systems are presented and evaluated. Thereby the search efficiency in structured and unstructured P2P overlays, the features and restrictions in P2P streaming applications, the service capacity in P2P file sharing systems, content download and replication times in P2P networks and many other issues are investigated. Furthermore the new extended model possibly combining the most essential characteristics of P2P systems in a consistent way is presented. The characteristics observed in the new model are categorized in three groups according to the P2P system properties: being described the overlay parameters, the characteristics of participating peers and the resource and service characteristics. Thereafter the objectives regulated by P2P applications, users and providers and aspects of underlying P2P systems they are interested in are observed. We consider the P2P applications Skype, Joost and KaZaA differentiating between the application users and providers and analyzing the technical view on the P2P system characteristics. A wide variety of existing P2P systems integrating the insights of distributed systems, databases, complexity theory and many other research areas raised inconsistencies and incompatibilities in used terminologies and abstractions. Therefore providing P2P systems interoperability and creating a common model applicable for all P2P systems became a desirable goal. In this thesis the existing P2P layer architectures considering P2P systems as a set of layers ordered according to their increasing degree of abstraction are presented. Furthermore each model layer its input, output and functionality are described individually.

Application of Numerical Methods in Engineering Problems using MATLAB® M.S.H. Al-Furjan, M. Rabani Bidgoli, Reza Kolahchi, A. Farrokhian, M.R. Bayati, 2024-01-31 Application of Numerical Methods in Engineering Problems Using MATLAB presents an analysis of structures using numerical methods and mathematical modeling. This structural analysis also includes beam, plate and pipe elements and examines deflection and frequency or buckling loads. The various engineering theories of beams, plates, shells are comprehensively presented and the relationships between stress and strain and the governing equations of the structure are extracted. To solve governing equations with numerical methods there are two general types including methods based on derivatives or integrals. Derivative based methods have the advantage of flexibility in modeling boundary conditions, low analysis time and a very high degree of accuracy. Therefore the book explains numerical methods based on derivatives especially the differential quadrature method. Features: Examines the application of numerical methods to obtain the deflection, frequency and buckling loads. Discusses the application of numerical methods for solving motion equations. Includes numerous practical and applicable examples throughout.
