

# Ethics in Research

## Part 1

**Why are ethics so important in research? List three key ethical principles. Elaborate on one principle- highlight how the principle ensures that research does not harm participants.**

In research, ethics is important because ethical norms enhance the objectives of the study, for instance, error avoidance, truth, and knowledge. Moral standards also improve the essential values for collaborative work, for example, trust, fairness, mutual respect, and accountability as research mostly entails coordination and cooperation between various groups from different organizations and disciplines. Many ethical standards ensure that researchers are responsible to the public for their study, which helps avoid misconducts and conflicts of interest, helps protect human participants, and helps care for animals used for research. Ethical standards are also useful in developing public support for the study as people can fund the research if they trust the integrity and quality of the research. Ethics promotes other essential social and moral values, for instance, human rights, social responsibility, compliance with regulation, animal welfare and public health and safety (Cunningham, Weathington & Pittenger, 2013). Three vital ethical principles include honesty, participant protection and integrity (Cunningham, Weathington & Pittenger, 2013). Researchers must protect participants from harm during research by ensuring that the risk of damage is less than the same risk in ordinary life. Researchers must also ask participants about any procedure aspects that may create a risk, for instance, current health conditions, and advise them on how to avoid the risk. The researcher must also inform participants of the study procedures early by highlighting possible danger. If the methods can lead to undesirable outcomes for a participant, the researcher must detect and correct or remove the results (Cunningham, Weathington & Pittenger, 2013).
