Development of Plug-in Hybrid Electric Motorcycle Powertrain System Mohd Izrey Izuan Mat Lazin, 2013

Plug-in hybrid electric vehicles are new alternatives that meet the efforts to develop more sustainable means of transportation and reduce fuel consumption. However, this trend could bring some circumstance to Powertrain systems such as limits space packaging weight of the Powertrain component and the capability of plug-in in recharging the battery for Powertrain system. The PHEV design plays a significant role in sizing of the battery pack and cost. To cope with some of those problems, this thesis proposes a development of plug-in hybrid electric motorcycle Powertrain system with the parallel Powertrain system configuration in order to achieve less emission and reduce fuel consumption. A 175 cc ICE motorcycle is selected and converted into a PHEM. A brushless DC BLDC motor assembled into working and integrating with ICE to propel the motorcycle. The nominal powers are 13.8 kW and 5 kW for the ICE and BLDC respectively. ADVISOR as a main program to simulate the Powertrain system for PHEM and compared the Powertrain system with the conventional. Modenas Jaguh 175cc. From the result, the PHEM can reduce fuel consumption while less emission produced by the Powertrain system. The performance for PHEM also can compete with the conventional although the weight for the PHEM is a little bit heavier.

Electric Motorcycle Revolution Shen Hao Harrison, 2025-08-13

Electric motorcycles are changing how people ride. These bikes run on batteries instead of gas, making them quiet and easy to use. They cost less to run than regular motorcycles because electricity is cheaper than fuel. You can charge them at home overnight, just like a phone, and wake up to a full battery. There are no oil changes or complicated engine parts to worry about. Many riders find them more enjoyable because they're smooth and simple. These motorcycles work well for daily trips and fun rides. They come in different styles for city streets or country roads. Some go fast for highway riding, while others are made for short trips around town. The battery lasts longer than many people think, often going 50-100 miles before needing a charge. New models keep improving, going farther and charging faster each year. Riders like not having to visit gas stations or breathe exhaust fumes. Taking care of an electric motorcycle is straightforward. The main things to check are tires, brakes, and keeping the battery charged properly. Unlike gas bikes, there's no engine that needs regular service. Most repairs can be done at home with basic tools. The battery lasts several years before needing replacement. Many companies offer warranties on the battery and motor for extra peace of mind. Riding electric feels different but good. The bike moves right away when you turn the throttle, with no gears to shift. The quiet ride lets you hear

the world around you The weight sits low making the bike stable and easy to handle Some people miss engine noise at first but most quickly enjoy the smooth ride It s a new experience that many riders prefer after trying it These motorcycles help the environment by creating no pollution They use energy more efficiently than gas vehicles As more electricity comes from clean sources like wind and solar riding becomes even greener Cities with many electric bikes have cleaner air and less noise Riders feel good knowing they re not adding to pollution problems It s one way to enjoy riding while being kind to the planet Electric motorcycles are becoming more popular every year Prices are getting lower as technology improves Governments in some places offer discounts to encourage people to buy them More charging stations are being built for longer trips The riding community is growing with meetups and events for electric bike fans For anyone thinking about getting a motorcycle electric models are worth considering for their simplicity low costs and enjoyable ride

Development of Plug in Drive Train System for Hybrid Electric Motorcycle Mustika Yasti Yasril,2013 This thesis writing discussed about the study of Development of Plug in Drive Train System for Hybrid Electric Motorcycle Generally Plug in hybrid electric vehicles PHEVs use batteries to power an electric motor and use another fuel such as gasoline or diesel to power an internal combustion engine Beyond battery storage and motor power parallel drivetrain configuration is used to combine the power from the electric motor and the engine allow them to switching between the two based on the drive profile this is called blended mode or mixed mode The major challenges in order to complete this project is to make sure drivetrain functions very well smooth during switching between modes thus not damaging the engine especially during blended mode To face these challenges it is important to develop drivetrain configuration thus analyze its final velocity power and torque required for each modes A review of literature made on the hybrid drivetrain systems outlines four different modes namely Electric Motor EM mode Internal Combustion Engine ICE mode blended mode and idle mode The configuration shows that each mode has its own functions and characteristics depends on speed demands and also needs at certain circumstances Mechanical coupling used to connects the engine and the electric motor to the drive shafts and before reach final drive there will be continuous variable transmission CVT component which act as main transmission instead of going through several gears to perform gear ratio change As final outcome drivetrain configuration that has been

finalized will be used as a benchmark to develop prototype of plug in hybrid drivetrain system thus works well with chassis and control system

Build Your Own Electric Motorcycle Carl Vogel, 2009-09-07 A step by step guide to building an electric motorcycle from the ground up Written by alternative fuel expert Carl Vogel this hands on guide gives you the latest technical information and easy to follow instructions for building a two wheeled electric vehicle from a streamlined scooter to a full sized motorcycle Build Your Own Electric Motorcycle puts you in hog heaven when it comes to hitting the road on a reliable economical and environmentally friendly bike Inside you ll find complete details on every component including motor batteries and frame The book covers electric motorcycles currently on the market and explains how to convert an existing vehicle Pictures diagrams charts and graphs illustrate each step along the way Whether you want to get around town on a sleek ride or cruise the super slab on a tricked out chopper this is the book for you Build Your Own Electric Motorcycle covers Energy savings and environmental benefits Rake trail and fork angle Frame and design Batteries and chargers DC and AC motor types Motor controllers Accessories and converters Electrical system and wiring Conversion process Safety maintenance and troubleshooting

Design and Fabrication of Retrofit E-bike Powertrain and Custom Lithium-ion Battery Pack Helena Wang, 2015 A chopper style bicycle was converted to a functional e bike with electric powertrain involving a hub motor a custom power source and throttle speed control A custom battery pack was designed to meet system performance specifications and fabricated using individual lithium ion cells Overall design parameters included form factor of power source system performance in terms of speed and weight torque and power provided by the motor and power source longevity of the battery pack and compact integration of the powertrain into the existing bicycle

PENTON - KTM 1972-1975 JACKPINER 175cc - HARE 250cc - MINT 400cc WORKSHOP MANUAL AND PARTS MANUALS Floyd Clymer, Penton Motorcycles, 2025-05-15 128 pages and more than 150 illustrations and charts size 8 25 x 10 75 inches This manual is a compilation of 3 publications 1 A workshop manual for the Penton 175cc Jackpiner the 250cc Hare Scrambler and the 400cc Mint models 2 An illustrated Frame and Chassis parts manual and 3 An illustrated 175 250 400cc KTM Engine Parts manual This publication is also appropriate for the KTM MC Motocross and GS Gelände Sport machines that utilize these same engines A BRIEF EXPLANATION OF THE ASSOCIATION BETWEEN PENTON AND KTM In 1967 when John Penton approached KTM Austria with a plan to manufacture off road motorcycles to his design it was obviously seen as an opportunity by KTM to gain a foothold in the expanding USA off road motorcycle market Certainly having someone like John Penton representing their product was a major win for KTM as John s prominent status in off road racing was already well established The first of the Penton KTM joint venture motorcycles the Berkshire 100 and Six Day 125 models powered by Sachs engines arrived in the USA in 1968 The use of a Sachs powertrain was an obvious choice for KTM who without any in house engine capability had been using Sachs engines in their moped scooter and road going motorcycles since the early 1950 s While the Sachs powered off road machines established a solid foothold for Penton motorcycles John began to

pressure KTM to construct an engine of their own design The first of the Penton models powered by KTM engines debuted in 1972 as the 175cc Jackpiner followed in 1973 by the 250cc Hare and the 400cc Mint in 1974 See Workshop Manual ISBN 9781588502933 for Sachs powered Pentons However KTM was also marketing identical KTM badged bikes as MC Motocross and GS Gelande Sport models on an international level Obviously this did not sit well with John and the situation worsened when those same KTM badged bikes began to show up on the west coast through a different USA importer The 1976 MC 5 and Cross Country and the 1977 GS 6 Pentons were also badged and sold as KTM s and the association between John and KTM continued to deteriorate In the interim KTM had been pressuring John to relinquish control of his distribution rights and in 1978 KTM purchased both the distribution rights and the company infrastructure and the Penton brand was no more A sad end to an era of great innovation by John Penton however his motorcycles and the identical KTM versions are regarded as some of the best ever to come out of the 1970 s off road motorcycle phenomenon and are highly collectible and still used in vintage events by enthusiasts worldwide Unfortunately owners of these early Penton motorcycles are subjected to considerable confusion surrounding the appropriate selection of the multitude of originals and reprints of the various manuals and parts lists that have recently flooded the marketplace We encourage you to exercise caution when purchasing a manual for your motorcycle or automobile as many of the reprints found on internet websites are from bedroom sellers at enticingly low prices by individuals that have no idea what they are selling Many are nothing more than poor quality comb bound or ring bound photocopies that are scanned and printed complete with greasy pages and thumbprints and as such are deceptively described as pre owned used or even refurbished In addition they are often advertised for the incorrect series and or model years

Riding Range Test Procedure for On-Highway Electric Motorcycles Motorcycle Technical Steering Committee,2022 This SAE Recommended Practice incorporates dynamometer test procedures that produce riding range estimates for electric motorcycles during stop and go urban riding on surface streets and commuting trips in urban areas that include operation on freeways This is typically done using a coastdown approach by disengaging the engine and assuming all losses are aerodynamic However with inherent losses in an electric motor and no way to fully disengage the

motor another approach is to use a on road constant speed Appendix B method for fully electric vehicles to develop dynamometer coefficients The previous version of this document states that the engine must be disengaged in order to obtain the losses from the system in motion In an electric vehicle there is no way to disengage the motor The range and losses that are obtained are false due to the fact that motor magnetic losses are inherent to the function of the motor even with regeneration backdriving the motor to energize the battery disengaged there are continuous losses in the system The proposed changes would be to use a continuous motion at a constant speed to determine the inherent losses of the system This proposed method may be used in all electrically driven vehicles
