

Lab Exercise 38.C: Evidence of Hereditary Material

Some studies have shown that the DNA of a cell is not destroyed when the cell is lysed, but is released into the surrounding medium. This has been used to show that DNA is the hereditary material. In this experiment, you will use a technique called the "Mandelstam-MacLeod" technique to show that DNA is the hereditary material. The technique involves the use of a special dye called "methyl green" which binds to DNA and is released when the DNA is released from the cell. The dye is then released into the surrounding medium and is released when the DNA is released from the cell. The dye is then released into the surrounding medium and is released when the DNA is released from the cell.

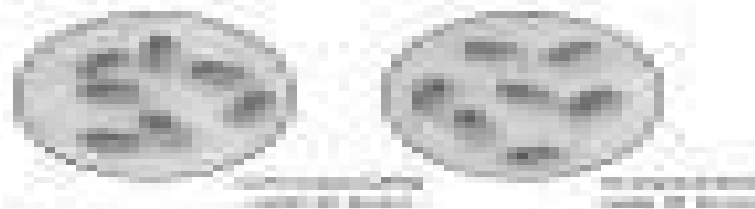

Figure 38.C.1
Control and DNA dishes showing the results of the experiment.

The following is an abbreviated summary of the experiment procedure.

Procedure:

1. Prepare a suspension of cells in a suitable medium (e.g., water) and add a suitable amount of the dye (methyl green) to the suspension.
2. Incubate the suspension for a suitable period of time (e.g., 10 minutes) at a suitable temperature (e.g., 37°C).

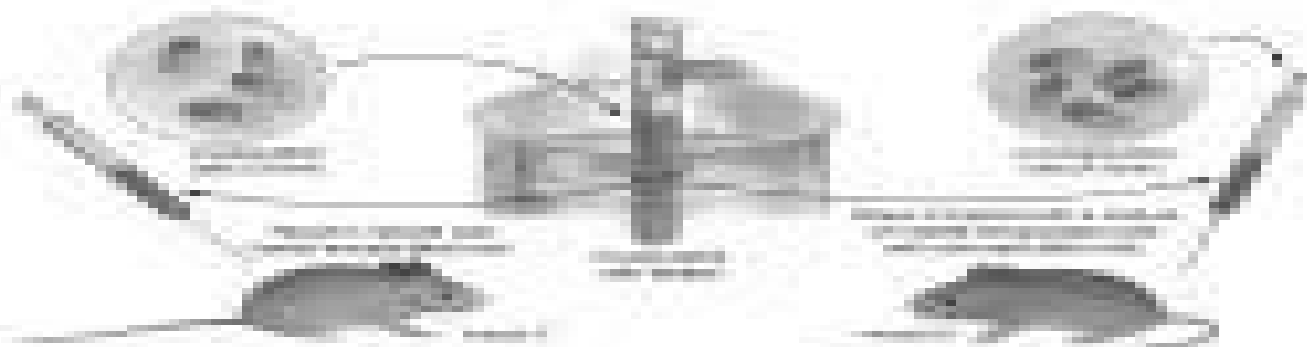

Figure 38.C.2
Experimental setup showing the results of the experiment.

3. The control suspension (e.g., water) will show a dark, cloudy liquid (e.g., water). The control suspension (e.g., water) will show a dark, cloudy liquid (e.g., water). The control suspension (e.g., water) will show a dark, cloudy liquid (e.g., water).
