Experiment 1: Rotational Inertia of a Pulley of Mass M and Radius R and Moment of Inertia of a Spring Balance

Part 1: Rotational Inertia of a Pulley of Mass

Equipment Required:

Rotating Table Apparatus, Tapes and Weight set, Spring Scale of the mass M of the cylinder pulley with phosphor-bronze spiral/braid balance springs

Purpose:

The purpose of this experiment is to find the rotational inertia I of a pulley mass experimentally and to verify that this value corresponds to the calculated theoretical value.

Theory:

Experimentally, the rotational inertia, I , of a pulley mass is given by $I = MR^2$, where M is the mass and R is the radius that mass is about the axis of rotation.

To find the rotational inertia experimentally, a known torque is applied to the pulley and the resulting angular acceleration is measured.

Since $\tau = I\alpha$, then $I = \frac{\tau}{\alpha}$, where τ is the applied torque.

The known acceleration is of the hanging mass is the tangential acceleration of the rotating apparatus. The angular acceleration is related to the tangential acceleration as follows: $\alpha = a/R$, where R is the radius of cylinder about which the mass is wound.

τ is the torque caused by the weight hanging from the thread which is wrapped around

the back of the apparatus, and is given by $\tau = rF$, where r is the radius of cylinder about which the thread is wound and F is the tension in the thread when the apparatus is rotating.
