

DNA Structure and Replication

How is genetic information stored and copied?

Why?

Deoxyribonucleic acid or **DNA** is the molecule of heredity. It contains the genetic blueprint for life. For organisms to grow and repair damaged cells, each cell must be capable of accurately copying itself. So how does the structure of DNA allow it to copy itself so accurately?

The Plant Plasma Membrane Christer Larsson, Ian M. Moller, 2012-12-06 The plasma membrane forms the living barrier between the cell and its surroundings For this reason it has a wide range of important functions related to the regulation of the composition of the cell interior and to communication with the cell exterior The plasma membrane has therefore attracted a lot of research interest Until the early 1970 s it was only possible to study the plasma membrane in situ its structure e g by electron microscopy and its function e g by uptake of radioactively labeled compounds into the intact cell or tissue The first isolation of plant protoplasts by enzymatic digestion of the cell wall in the early 1970 s was an important step forward in that it provided direct access to the outer surface of the plasma membrane More importantly T K Hodges and R J Leonard in 1972 published the description of a method by which a fraction enriched in plasma membranes could be isolated from plant tissues using sucrose gradient centrifugation As a result the 1970 s saw a leap forward in our understanding of the structure and function of the plasma membrane In 1981 S Widell and C Larsson published the first of a series of papers in which plasma membrane vesicles of high yield and purity were isolated from a wide range of plant tissues using aqueous polymer two phase partitioning

Molecular Dynamics in Biological Membranes Milton H.Jr. Saier, Charles D. Stiles, 1975-12-22 There is something fascinating about science One gets such wholesale returns of conjecture out of such a trifling investment of fact Mark Twain The recent explosion in our knowledge of basic physiologic processes molecular biology and genetic regulatory mechanisms has resulted in large measure from a single conceptual advance the realization that at the molecular level evolutionarily divergent organisms are more similar than different Thus in *Escherichia coli* and *Homo sapiens* the enzymatic pathways for the utilization of galactose and glucose are the same although more than a single sequence of enzymatic reactions can lead to the utilization of either sugar Also extensive studies have revealed the essential of the genetic code the mechanism of decy universality ribonucleic acid DNA replication and the processes by which genetic information is transcribed to ribonucleic acid RNA and RNA is translated into protein A detailed comparative examination of any one area of biologic interest of course reveals differences among phylogenetically distinct organisms In prokaryotic organisms protein synthesis is initiated with N formyl methionyl transfer RNA tRNA whereas methionyl tRNA serves this function in the cytoplasm of the eukaryote Mechanistic differences may have evolved to accommodate the differing degrees of complexity of cellular construction or to coordinate functions of differentiated cells in a multicellular organism Yet we must realize that the basic life endowing molecular processes had to exist prior to extensive evolutionary divergence before the appearance of two distinct cell types

Biological Membranes Kenneth M. Merz, Benoit Roux, 2012-12-06 The interface between a living cell and the surrounding world plays a critical role in numerous complex biological processes Sperm egg fusion virus cell fusion exocytosis endocytosis and ion permeation are a few examples of processes involving membranes In recent years powerful tools such as X ray crystallography electron microscopy nuclear magnetic resonance and infra red and Raman spectroscopy have been developed to characterize the structure and dynamics of biomembranes Despite this progress many of the factors responsible for the function of biomembranes are still not well understood The membrane is a very complicated supramolecular liquid crystalline structure that is largely composed of lipids forming a bilayer to which proteins and other biomolecules are anchored Often the lipid bilayer environment is pictured as a hydrophobic structureless slab providing a thermodynamic driving force to partition the amino acids of a membrane protein according to their solubility However much of the molecular complexity of the

phospholipid bilayer environment is ignored in such a simplified view. It is likely that the atomic details of the polar head group region and the transition from the bulk water to the hydrophobic core of the membrane are important. An understanding of the factors responsible for the function of biomembranes thus requires a better characterization at the molecular level of how proteins interact with lipid molecules, of how lipids affect protein structure, and of how lipid molecules might regulate protein function. **Biomembrane Structure and Function** Dennis Chapman, 1983-06-18

Characterization of Biological Membranes Mu-Ping Nieh, Frederick A. Heberle, John Katsaras, 2019-07-22. The study of membranes has become of high importance in the fields of biology, pharmaceutical chemistry, and medicine since much of what happens in a cell or in a virus involves biological membranes. The current book is an excellent introduction to the area which explains how modern analytical methods can be applied to study biological membranes and membrane proteins and the bioprocesses they are involved in. *Biochemistry of Cell Membranes* S. Papa, J.M. Tager, 2012-12-06. This book consists of a series of reviews on selected topics within the rapidly and vastly expanding field of membrane biology. Its aim is to highlight the most significant and important advances that have been made in recent years in understanding the structure, dynamics, and functions of cell membranes. Areas covered in this monograph include: Signal Transduction, Membrane Traffic, Protein and Lipids, Bioenergetics, Energy Transfer, and Membrane Transport, Cellular Ion Homeostasis, Growth Factors, and Adhesion Molecules, Structural Analysis of Membrane Proteins, Membranes and Disease, Biochemistry of Cell Membranes.
