**Enhancing Upper-level Performance from Below** Ruofan Jin,2015 *Real-time Resource Allocation and Optimization in Wireless Networks* Kartik Dhananjay Pandit,2013 Resource allocation in a multi user system is an important problem With the availability of cheap and powerful processing capability these resource allocation problems can now be solved using real time optimization methods While the solution is often specific to the resource allocation problem real time optimization methods use real time data to determine the resource allocation in the next time step In this dissertation we consider multi user resource allocation problems in two different but related application areas

namely vehicular transportation networks and radio access networks of cellular networks which are solved using real time optimization methods The application of real time optimization in the transportation network deals with the traffic signal control of a single intersection Unlike traditional traffic signal control we consider a system enhanced with Vehicular Ad hoc Networks VANETs that enables wireless vehicle to vehicle V2V and vehicle to infrastructure V2I communication The key resource in the traffic signal control is the green time and the objective is to minimize vehicular delays at the intersection Applying techniques from graph theory and processor scheduling we model the problem as a real time job scheduling problem on processors and propose an online scheduling algorithm We prove performance bounds of the online algorithm under the assumption that jobs are of equal size We then show how VANET can be used gather real time traffic information to group vehicles into approximately equal sized platoons which can then be scheduled using the online algorithm Using a detailed simulation analysis we show that the proposed algorithm reduces the delays experienced by vehicles as they pass through the intersection compared to well known traffic signal control algorithms The second application of real time optimization deals with the resource allocation in the radio access network for unicast video in the uplink of a WCDMA based cellular network The key resource is the transmit power and the objective is to maximize the received video quality We adopt the Content Aware Networking framework to do cross layer optimization of video applications in wireless networks The objective is to maximize average video quality seen by the mobile users given channel interference constraints The resource is transmit power and we model the problem as a Multiple Knapsack Problem and use a real time knapsack optimization to solve the problem We test the performance of the algorithm on a WCDMA emulator and our results show that the video quality seen is significantly improved The third problem is optimization of unicast video and radio resource allocation in the LTE downlink Our objective is to maximize the average video quality seen by mobile users in a single LTE cell while constrained by limited number of available physical resource blocks PRBs We again leverage the Content Aware Networking Framework and model the problem as a real time constrained optimization problem and solve it using a real time knapsack optimization To test the performance of our solution we built a realistic model of the LTE downlink where in order to obtain a good fit we used real channel data obtained through drive tests Our results show that for a fixed number of PRBs the average video quality experienced by users is improved significantly The common underlying theme of the three problems addressed in this dissertation is the use of real time optimization In particular the resource allocation optimizer uses real time measurements of the system state that is enabled by the wireless technology The optimizer makes a resource allocation decision for a finite period of time called the optimization horizon This cycle is then repeated with the system state being measured and supplied to the optimizer While the length of the optimization horizon depends on the application the optimization algorithms we describe and implement are fast both asymptotically and practically and allow for fine grain optimization horizons
