7.0 Introduction

CAD Lab 7 is on three-dimensional (3D) drawing and covers the following:

- section and slice of 3D solids, and
- hatching.

## 7.1 Section

Command line: section   *Shortcut*: sec

This command requires specification of a *section plane* on a 3D solid, the intersection of which results in a *sectioned region*. Note that the *section* command only creates a 2D sectioned region and does not remove the sectioned portion. The following steps outline the procedure for using the *section* command:

- Start the *section* command.
- Select the object(s) to section and then press enter.
- Specify first point on section plane by [*Object/Zaxis/View/XY/YZ/ZX/3points*].
Object

- The objects that can be selected are circle, ellipse, arc, 2D spline, and 2D polylines. The object should be made from the same view from which the section plane will be looked at. As an example, if the section plane is to be viewed from the front, the polyline should also be made on the front view. However, when using the section command, the view should always be changed to top. In the example given below, the given polyline is used for sectioning.

ZAxis

- Requires the specification of a point on the section plane and another point on the z-axis, that is, perpendicular to the section plane.
