

Optimization Toolbox 6.0

Solve standard and large-scale optimization problems

Optimization Toolbox™ provides widely used algorithms for standard and large-scale optimization. These algorithms solve constrained and unconstrained continuous and discrete problems. The toolbox includes functions for linear programming, quadratic programming, binary integer programming, nonlinear optimization, nonlinear least squares, systems of nonlinear equations, and multiobjective optimization. You can use them to find optimal solutions, perform tradeoff analyses, balance multiple design alternatives, and incorporate optimization methods into algorithms and models.

Key Features

- Interactive tools for defining and solving optimization problems and monitoring solution progress
- Solvers for nonlinear and multiobjective optimization
- Solvers for nonlinear least-squares, data fitting, and nonlinear equations
- Methods for solving quadratic and linear programming problems
- Methods for solving binary integer programming problems

Optimization Toolbox for Use with MATLAB, 2000 **Switched Reluctance Motor Drives** Berker Bilgin, James Weisheng Jiang, Ali Emadi, 2019-04-29 Electric motors are the largest consumer of electric energy and they play a critical role in the growing market for electrification Due to their simple construction switched reluctance motors SRMs are exceptionally attractive for the industry to respond to the increasing demand for high efficiency high performance and low cost electric motors with a more secure supply chain Switched Reluctance Motor Drives Fundamentals to Applications is a comprehensive textbook covering the major aspects of switched reluctance motor drives It provides an overview of the use of electric motors in the industrial residential commercial and transportation sectors It explains the theory behind the operation of switched reluctance motors and provides models to analyze them The book extensively concentrates on the fundamentals and applications of SRM design and covers various design details such as materials mechanical construction and controls Acoustic noise and vibration is the most well known issue in switched reluctance motors but this can be reduced significantly through a multidisciplinary approach These methodologies are explained in two chapters of the book The first covers the fundamentals of acoustic noise and vibration so readers have the necessary tools to analyze the problems and explains the surface waves spring mass models forcing harmonics and mode shapes that are utilized in modeling and analyzing acoustic noise and vibration The second applies these fundamentals to switched reluctance motors and provides examples for determining the sources of any acoustic noise in switched reluctance motors In the final chapter two SRM designs are presented and proposed as replacements for permanent magnet machines in a residential HVAC application and a hybrid electric propulsion application It also shows a high power and compact converter design for SRM drives Features Comprehensive coverage of switched reluctance motor drives from fundamental principles to design operation and applications A specific chapter on electric motor usage in industrial residential commercial and transportation applications to address the benefits of switched reluctance machines Two chapters address acoustic noise and vibration in detail Numerous illustrations and practical examples on the design modeling and analysis of switched reluctance motor drives Examples of switched reluctance motor and drive design MATLAB, 2004 *Inelastic Analysis of Structures under Variable Loads* Dieter Weichert, Giulio Maier, 2012-12-06 The question whether a structure or a machine component can carry the applied loads and with which margin of safety or whether it will become unserviceable due to collapse or excessive inelastic deformations has always been a major concern for civil and mechanical engineers The development of methods to answer this technologically crucial question without analysing the evolution of the system under varying loads has a long tradition that can be traced back even to the times of emerging mechanical sciences in the early 17th century However the scientific foundations of the theories underlying these methods nowadays frequently called direct were established sporadically in the Thirties of the 20th century and systematically and rigorously in the Fifties Further motivations for the development of direct

analysis techniques in applied mechanics of solids and structures arise from the circumstance that in many engineering situations the external actions fluctuate according to time histories not a priori known except for some essential features e.g. variation intervals. In such situations the critical events or limit states to consider besides plastic collapse are incremental collapse or ratchetting and alternating plastic yielding namely lack of shakedown. Non evolutionary direct methods for ultimate limit state analysis of structures subjected to variably repeated external actions are the objectives of most papers collected in this book which also contains a few contributions on related topics.

Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems Yihui Wang, Bin Ning, Ton van den Boom, Bart De Schutter, 2016-04-21

This book contributes to making urban rail transport fast, punctual and energy efficient, significant factors in the importance of public transportation systems to economic, environmental and social requirements at both municipal and national levels. It proposes new methods for shortening passenger travel times and for reducing energy consumption, addressing two major topics: 1. train trajectory planning: the authors derive a nonlinear model for the operation of trains and present several approaches for calculating optimal and energy efficient trajectories within a given schedule; and 2. train scheduling: the authors develop a train scheduling model for urban rail systems and optimization approaches with which to balance total passenger travel time with energy efficiency and other costs to the operator. Mixed integer linear programming and pseudospectral methods are among the new methods proposed for single and multi train systems for the solution of the nonlinear trajectory planning problem which involves constraints such as varying speed restrictions and maximum traction/braking force. Signaling systems and their effects are also accounted for in the trajectory planning model. Origin/destination passenger demand is included in the model formulation for train scheduling. Iterative convex programming and efficient bi-level approaches are utilized in the solution of the train scheduling problem. In addition, the splitting rates and route choices of passengers are also optimized from the system point of view. The problems and solutions described in *Optimal Trajectory Planning and Train Scheduling for Urban Rail Transit Systems* will interest researchers studying public transport systems and logistics, whether from an academic or practitioner background, as well as providing a real application for anybody studying optimization theory and predictive control.
