

Lab Report – Skeletal Muscle

In science, reporting what has been done in a laboratory setting is incredibly important for communicating, replicating, and validating findings. However, writing scientific reports can be a little overwhelming. There are a set of agreed upon components that the scientific community requires when reporting scientific research. Answer the following questions to describe what occurred during the lab you conducted in Labster. Be sure to use complete sentences and descriptions that fully represent what you experienced. Writing a lab report is less about being correct or incorrect, than it is accurately reporting what happened and why. So, do not worry about reporting data that might seem counterintuitive or unexpected. Focus on clearly communicating what you did and what you observed.

Enter your responses on a new line.

Title

1. What was the title of the lab you completed?

The Skeletal Muscle Lab

Topic

2. What was the subject you were trying to understand better in the lab?

I was learning more in-depth information on the muscles we use to walk and run.

Background Information

3. What information from the textbook and classroom is relevant for the subject you were learning about in the lab? Identify the concepts and explain how they are related to the lab topic.

In order to understand many aspects of this lab, we need a good understanding of muscle tissues. During contraction, muscle cells can shorten, which generates a pulling force. As a result of this contraction, the bones move. Skeletal muscle fibers cause bone motion, maintain posture, stabilize bones, control internal movement, and generate heat. Muscle fiber types are also discussed in the book. The three mechanisms of ATP regeneration are anaerobic glycolysis, aerobic metabolism, and creatine phosphate. The three types of muscle fibers are slow oxidative, fast oxidative and fast glycolytic. A slow oxidative fiber uses aerobic metabolism to produce high power contractions with little fatigue over an extended period. A fast oxidative fiber utilizes aerobic metabolism to produce ATP but produces a higher tension contraction than a slow oxidative fiber. Lastly, fast glycolytic fibers use anaerobic metabolism to produce more high-tension contractions but fatigue quickly.
