injection projects are reviewed as are those from CO2 natural analog sites Lastly the book presents relevant risk management methods Geological storage of CO2 is widely considered to be a key technology capable of substantially reducing the amount of CO2 released into the atmosphere thereby reducing the negative impacts of such releases on the global climate Around the world projects are already in full swing while others are now being initiated and executed to demonstrate the technology Deep saline formations are the geological formations considered to hold the highest storage potential due to their abundance worldwide To date however these formations have been relatively poorly characterized due to their low economic value Accordingly the processes involved in injecting and storing CO2 in such formations still need to be better quantified and methods for characterizing modeling and monitoring this type of CO2 storage in such formations must be rapidly developed and refined
