

### Evaporative cooling

The curves in fig. Th.9 clearly show how power and efficiency increase as the compressor inlet temperature decreases.

The latter can be reduced artificially by using an evaporative cooler located upstream of the suction filter.

Water, separated into drops or in the form of a liquid film, cools the air by evaporating in the cooler as it flows in the opposite direction, thus originating an adiabatic-isenthalpic exchange (see fig. Th.14).

**Fig. Th.14 Evaporative cooler**

In order to prevent water from being drawn towards the compressor and fouling it, downstream of the cooler there are one or more stages of drop separators (demisters), which separate by inertia any water drops that might be entrained downstream of the cooler by the flow of air ingested by the turbine.

Fig. Th.15 shows the effects of evaporative cooling on the gas turbine output power and heat rate.

As can be noted, benefits increase as relative humidity decreases and ambient temperature increases.

Unfortunately, the above requirements are met in environments (for example, deserts), where the amount of water needed by the cooler is not always available.
