Chemistry in Microelectronics Yannick Le Tiec, 2013-02-28 Chemistry in Microelectronics Microelectronics is a complex world where many sciences need to collaborate to create nano objects we need expertise in electronics microelectronics physics optics and mechanics also crossing into chemistry electrochemistry as well as biology biochemistry and medicine Chemistry is involved in many fields from materials chemicals gases liquids or salts the basics of reactions and equilibrium to the optimized cleaning of surfaces and selective etching of specific layers In addition over recent decades the size of the transistors has been drastically reduced while the functionality of circuits has increased This book consists of five chapters covering the chemicals and sequences used in processing from cleaning to etching the role and impact of their purity along with the materials used in Front End Of the Line which corresponds to the heart and performance of individual transistors then moving on to the Back End Of the Line which is related to the interconnection of all the transistors Finally the need for specific functionalization also requires key knowledge on surface treatments and chemical management to allow new applications

Nuclear Science Abstracts ,1971-04 Index Medicus ,2001 Biogeochemical Cycling and Depositional Processes of Critical Metals in the Deep Sea and Their Constraints on Global Changes Jiangbo Ren, Yanhui Dong, Xiaodong Jiang , Francisco Javier González, 2025-10-28 Critical metals such as cobalt Co nickel Ni and rare earth elements REEs are highly concentrated in deep sea sediments particularly in ferromanganese deposits mainly due to low sedimentation rate and low detrital input The deep sea water sediment interface constitutes a pivotal area for the biogeochemical cycling and depositional processes of critical metal elements However the behavior of critical metals at the deep seawater sediment interface is complicated by global or regional environmental factors such as encompassing changes in productivity redox alterations ocean current dynamics volcanism hydrothermalism tectonic activity A comprehensive understanding of the migration of critical metals between seawater and pore water their accumulation and occurrence characteristics in solid mineral resources and sediments as well as their preservation status holds paramount significance in

systematically elucidating the formation mechanism of solid minerals and accurately interpreting paleoenvironmental records Exploring the deposition and enrichment of critical metals in the deep sea through the lens of biogeochemical cycles and global change is poised to yield significant scientific insights The focus of this Research Topic is to study critical metals across the marine environment encompassing seawater pore water and deep sea sediments to explore the behavior of the elements in seawater seafloor deposition and enrichment processes and their constraints on global change This Research Topic calls for original and novel papers that explore biogeochemical cycling and depositional processes of critical elements in the deep sea and their constraints on global changes We invite submissions that address but are not limited to the following topics 1 The trace metal distributions in the water column at the seawater sediment interface and within sediments reveal elemental biogeochemical behavior in the ocean 2 Polymetallic ferromanganese depositional profiles record critical metal enrichment processes in a long period changing environment 3 Deep sea sediments and ferromanganese deposits are important elemental and isotopic archives that record important global change events 4 Deep sea sedimentation in response to bottom current including Antarctic Bottom Water 5 Biomineralization processes and seafloor metals deposition
