

## KEYSTONE REVIEW PACKET ANCHOR 4: Homeostasis and Transport

### LEARNING OBJECTIVES:

- Identify and describe the cell structures involved in transport of materials into, out of, and throughout the cell
  - Describe how the structure of the plasma membrane allows it to function as a regulatory structure and/or protective barrier for a cell
  - Compare the mechanisms that transport materials across the plasma membrane (i.e., passive transport – diffusion, osmosis, facilitated diffusion; and active transport – pumps, endocytosis, exocytosis)
  - Describe how membrane-bound cellular organelles (e.g., endoplasmic reticulum, Golgi apparatus) facilitate the transport of materials within a cell
- Explain mechanisms that permit organisms to maintain biological balance between their internal and external environments
  - Explain how organisms maintain homeostasis (e.g. thermoregulation, water regulation, oxygen regulation)

### Main Concept 1: Describe how the structure of the plasma membrane allows it to function as a regulatory structure and/or protective barrier for a cell

- Cell Membrane** - surrounds the cell. It plays an active role in determining which substances enter and exit the cell. Some substances can pass freely through the cell membrane and others cannot, the membrane is said to be selectively permeable, or semipermeable. The cell membrane is composed primarily of lipids (phospholipids), proteins, and carbohydrates.
- Phospholipids** - have a polar, hydrophilic (water loving) phosphate head and 2 nonpolar hydrophobic (water fearing) fatty acid tails. They arrange themselves in a double layer (phospholipid bilayer) so that the heads face the outer and inner cell surfaces and the tails are sandwiched in between.
- Cholesterol** – small molecules inserted between the lipids, help to maintain membrane fluidity and prevent membrane from freezing at low temperatures.
- Membrane proteins** – different types of proteins are embedded in the membrane to perform different functions such as transport of materials, and enzymes to regulate reactions.
- Carbohydrates** – used for cell to cell communication and cell identification

\*Fluid Mosaic Model - **model** that describes the structure of cell membranes. In this **model**, a flexible layer made of lipid molecules is interspersed with large protein molecules that act as channels through which other molecules enter and leave the cell

Lang,C. Ronco,2006 It is essential for the survival of cells to maintain their volume within certain limits. Profound alterations interfere with the integrity of the cell membrane and the cytoskeletal architecture. Cells use various methods to adjust osmotic pressure gradients which in turn govern water movement across cell membranes. The most rapid and efficient means is ion transport across the cell membrane. However, to avoid excessive alterations of intracellular ion concentration, cells additionally employ organic osmolytes for osmoregulation and modify their metabolism, thus generating or disposing osmotically active organic substances. But a given cell uses only part of the cell volume regulatory mechanisms at their disposal. The large repertoire available allows for a selection of those which have the least untoward impact on cell function. The present book is a collection of reviews on the various aspects of cell volume regulation, written by internationally leading experts and constitutes a valuable addition to the library of those working in the field.
