**Ultra-Low Energy Domain-Specific Instruction-Set Processors** Francky Catthoor, Praveen Raghavan, Andy Lambrechts, Murali Jayapala, Angeliki Kritikakou, Javed Absar, 2010-08-05 Modern consumers carry many electronic devices like a mobile phone digital camera GPS PDA and an MP3 player The functionality of each of these devices has gone through an important evolution over recent years with a steep increase in both the number of features as in the quality of the services that they provide However providing the required compute power to support an uncompromised combination of all this functionality is highly non trivial Designing processors that meet the demanding requirements of future mobile devices requires the optimization of the embedded system in general and of the embedded processors in particular as they should strike the correct balance between flexibility energy efficiency and performance In general a designer will try to minimize the energy consumption as far as needed for a given performance with a sufficient flexibility However achieving this goal is already complex when looking at the processor

in isolation but in reality the processor is a single component in a more complex system In order to design such complex system successfully critical decisions during the design of each individual component should take into account effect on the other parts with a clear goal to move to a global Pareto optimum in the complete multi dimensional exploration space In the complex global design of battery operated embedded systems the focus of Ultra Low Energy Domain Specific Instruction Set Processors is on the energy aware architecture exploration of domain specific instruction set processors and the co optimization of the datapath architecture foreground memory and instruction memory organisation with a link to the required mapping techniques or compiler steps at the early stages of the design By performing an extensive energy breakdown experiment for a complete embedded platform both energy and performance bottlenecks have been identified together with the important relations between the different components Based on this knowledge architecture extensions are proposed for all the bottlenecks

**Embedded System Design with ARM Cortex-M Microcontrollers** Cem Ünsalan,Hüseyin Deniz Gürhan,Mehmet Erkin Yücel,2022-01-03 This textbook introduces basic and advanced embedded system topics through Arm Cortex M microcontrollers covering programmable microcontroller usage starting from basic to advanced concepts using the STMicroelectronics Discovery development board Designed for use in upper level undergraduate and graduate courses on microcontrollers microprocessor systems and embedded systems the book explores fundamental and advanced topics real time operating systems via FreeRTOS and Mbed OS and then offers a solid grounding in digital signal processing digital control and digital image processing concepts with emphasis placed on the usage of a microcontroller for these advanced topics The book uses C language the programming language for microcontrollers C language and MicroPython which allows Python language usage on a microcontroller Sample codes and course slides are available for readers and instructors and a solutions manual is available to instructors The book will also be an ideal reference for practicing engineers and electronics hobbyists who wish to become familiar with basic and advanced microcontroller concepts
