Communication Engineering Dr. V.Nagaraj, Ms. M. Thamizhselvi, An information exchange between two points is described by the communication system. Communication is the process of sending and receiving information. The information transmitter, the channel or medium of communication, and the information receiver are the three main components of communication. This book deals with five major essentials and emerging communication systems starting with Analog, Digital, Optical, Satellite, and Mobile Communication.

1. Analog Communication System: It transmits data using analogue signals. Radios AM and FM are two examples.
2. Digital Communication System: It transmits data using digital signals. Mobile phones and the internet are two examples.
3. Optical Communication System: It communicates by means of light waves. Cables made of fibre optics are an example.
4. Satellite Communication System: Long distance information transmission is done using satellites. GPS and satellite television are two examples.
5. Mobile Communication: It transmits information wirelessly using radio waves. Bluetooth and Wi-Fi are two examples. It enables two-way conversation between the parties. Phones and walkie-talkies are two examples. One-to-many communication is possible with the broadcast communication system. Radio and television broadcasts are two examples. Point-to-Point System of Communication: It enables communication between two particular parties. Email and telephones are two examples.

ADVANCED COMMUNICATION AND EMBEDDED CONTROLLERS Dr.

Rekha, 2024-03-03. Microwave is a line of sight wireless communication method that makes use of high recurrence light emissions waves to provide high velocity wireless associations that are capable of transmitting and receiving speech, video, and information data. It is common practice to make use of microwave radio transmission in the context of satellite communications, deep space radio transmissions, and highlight point communication systems that are located on the outer layer of the Earth. When it comes to radars, radio route frameworks, sensor frameworks, and radio astronomy, various portions of the microwave radio band are used. For the upper portion of the radio electromagnetic spectrum, which includes frequencies ranging from 30 GHz to 100 GHz, the term millimeter waves is used to characterize the phenomenon. Millimeters are used to measure their frequencies, which normally fall within the range of 10 mm to 30 mm. This is the reason why this is the case. In general, the strength of radio waves in this band is highly influenced by the atmosphere of the Earth and the particles that are trapped inside it, particularly in settings that are humid. The phrase microwave connect refers to a particular type of communication system that makes use of light emission waves that fall within the microwave frequency range in order to send data, video, or audio between two locations regardless of how far away they are. With the use of IP header pressure mechanisms and 256QAM, balancing contemporary microwave lines are able to transmit data at speeds of up to 400 Mbps across channels operating at 56 MHz. The working distances for microwaves are not predetermined by the receiving wire size, gain, the recurrence band, or the connection restriction. Unprotected Microwave connections that do not benefit from diversity or insurance are referred to as Unprotected and are also referred to as 1.0. In addition to the introduction of a single group of hardware, there is neither diversification nor reinforcement. *Announcement of Army*
