and hence lower nanofiller concentrations are needed to attain properties comparable to or even better than those obtained by conventional microfiller loadings which facilitates processing and minimizes the increase in composite weight. The addition of nanoparticles into different polymer matrices opens up an important research area in the field of composite materials. Moreover, many different types of inorganic nanoparticles such as quantum dots, metal oxides, and ceramic and metallic nanoparticles have been incorporated into polymers for their application in a wide range of fields ranging from medicine to photovoltaics, packaging, and structural applications. *Materials Science and Engineering* William D. Callister, 1997. In this introduction to materials science and engineering, William Callister provides a treatment of the important properties of three types of materials: metals, ceramics, and polymers. **Materials Science and Engineering** Callister, 2013-08-15. **Materials Processing for Engineering Manufacture** Zainul Huda, 2016-11-10.
