release Low Gear. A failure cannot reselect it. When a shift to Low Gear is appropriate, the logic first determines that no malfunctions exist, then a specific sequence of solenoid commands is used to shift the valve and again select Low Gear.

The control electronics are located underhood in a potted, die cast aluminum housing with a sealed, 40-way connector. On New Yorker, and New Yorker Landau, Dynasty, Spirit and Acclaim, the control computer is located on the right fender side shield. On Caravan and Voyager it is located on the right side of the dash panel.

The transmission control computer for the Dodge Caravan and Plymouth Voyager includes control logic to protect the transmission from overheating. In trailer towing situations where the vehicle is operated in "D" which does not permit a shift to overdrive, the torque converter will lock up in 2nd as well as 3rd gear if the coolant temperature becomes moderately high. This reduces transmission heat rejection by reducing torque converter slippage and reduces engine heat rejection by lowering engine speed.

Through the use of SMD's (surface mount devices) and ASIC's (application-specific integrated circuits), the controller size was minimized. The electrical power requirements of the control system have been minimized by using switch-mode, current-controlled solenoid drivers and an efficient CMOS (complementary metal-oxide semi-conductor) microprocessor. These features combine to provide a state-of-the-art control system for the transmission.
