Actinobacteria in Special and Extreme Habitats: Diversity, Function Roles and Environmental Adaptations Sheng Qin, Wen-Jun Li, Syed G. Dastager, Wael N. Hozzein, 2016-11-09 Actinobacteria are highly diverse prokaryotes that are ubiquitous in soil freshwater and marine ecosystems Although various studies have focused on the ecology of this phylum data are still scant on the diversity abundance and ecology of actinobacteria endemic to special and extreme environments such as gut plant alkaline saline soil deep sea sediments hot springs and other habitats Actinobacteria are well known producers of a vast array of secondary metabolites many of which have useful applications in medicine and agriculture Furthermore actinobacteria also have diverse functions in different environments apart from antibiotic production For example actinobacteria are reported to contribute to the break down and recycling of organic compounds They play a significant role in fixation of nitrogen improvement plant growth biodegradation bioremediation and environmental protection Therefore understanding the actinobacterial diversity and distribution in such special environments is important in deciphering the ecological roles of these microorganisms and for biotechnological bioprospecting Recent advances in cultivation DNA sequencing technologies and omics metagenomics metaproteomics etc methods have greatly contributed to the rapid advancement of our understanding of microbial diversity function and they interactions with environment Furthermore comparative genomic studies can provide overall information about actinobacterial speciation evolution metabolism and environment adaptation mechanisms This research topic comprising reviews and original articles highlights the recent advances regarding the unexpectedly diverse rare group of actinobacteria with special selective isolation methods or culture independent methods as well as their biological activities ecophysiological function and mechanisms from diverse special and extreme environments

Orenstein, 2009-09-18 Recent years have seen unprecedented outbreaks of avian influenza A viruses In particular highly pathogenic H5N1 viruses have not only resulted in widespread outbreaks in domestic poultry but have been transmitted to humans resulting in numerous fatalities The rapid expansion in their geographic distribution and the possibility that these viruses could acquire the ability to spread from person to person raises the risk that such a virus could cause a global pandemic with high morbidity and mortality An effective influenza vaccine represents the best approach to prevent and control such an emerging pandemic However current influenza vaccines are directed at existing seasonal influenza viruses which have little or no antigenic relationship to the highly pathogenic H5N1 strains Concerns about pandemic preparedness have greatly stimulated research activities to develop effective vaccines for pandemic influenza viruses and to overcome the limitations inherent in current approaches to vaccine production and distribution These limitations include the use of embryonated chicken eggs as the substrate for vaccine production which is time consuming and could involve potential biohazards in growth of new virus strains Other limitations include the requirement that the current inactivated influenza vaccines be administered using needles and syringes requiring trained personnel which could be a bottleneck when attempting to vaccinate large populations in mass campaigns In addition the current inactivated vaccines that are delivered by injection elicit limited protective immunity in the upper respiratory tract where the infection process is initiated **Regulation of Gene Expression in Enteropathogenic Bacteria, Volume II** Dongsheng Zhou, Shihua
