Davenport-Zannier Polynomials and Dessins d'Enfants Nikolai M. Adrianov, Fedor Pakovich, Alexander K. Zvonkin, 2020-06-29 The French expression *dessins d'enfants* means children's drawings This term was coined by the great French mathematician Alexandre Grothendieck in order to denominate a method of pictorial representation of some highly interesting classes of polynomials and rational functions The polynomials studied in this book take their origin in number theory The authors show how by drawing simple pictures one can prove some long standing conjectures and formulate new ones The theory presented here touches upon many different fields of mathematics The major part of the book is quite elementary and is easily accessible to an undergraduate student The less elementary parts such as Galois theory or group representations and their characters would need a more profound knowledge of mathematics The reader may either take the basic facts of these theories for granted or use our book as a motivation and a first approach to these subjects

Transport Processes at Fluidic Interfaces Dieter Bothe, Arnold Reusken, 2017-07-13 There are several physico chemical processes that determine the behavior of multiphase fluid systems e g the fluid dynamics in the different phases and the dynamics of the interface s mass transport between the fluids adsorption effects at the interface and transport of surfactants on the interface and result in heterogeneous interface properties In general these processes are strongly coupled and local properties of the interface play a crucial role A thorough understanding of the behavior of such complex flow problems must be based on physically sound mathematical models which especially account for the local processes at the interface This book presents recent findings on the rigorous derivation and mathematical analysis of such models and on the development of numerical methods for direct numerical simulations Validation results are based on specifically designed experiments using high resolution experimental techniques A special feature of this book is its focus on an interdisciplinary research approach combining Applied Analysis Numerical Mathematics Interface Physics and Chemistry as well as relevant research areas in the Engineering Sciences The contributions originated from the joint interdisciplinary research projects in the DFG Priority Programme SPP 1506 Transport Processes at Fluidic Interfaces

Colored Discrete Spaces Luca Lionni, 2018-08-01 This book provides a number of combinatorial tools that allow a systematic study of very general discrete spaces involved in the context of discrete quantum gravity In any dimension D we can discretize Euclidean gravity in the absence of matter over random discrete spaces obtained by gluing families of polytopes together in all possible ways These spaces are then classified

according to their curvature In D 2 it results in a theory of random discrete spheres which converge in the continuum limit towards the Brownian sphere a random fractal space interpreted as a quantum random space time In this limit the continuous Liouville theory of D 2 quantum gravity is recovered Previous results in higher dimension regarded triangulations converging towards a continuum random tree or gluings of simple building blocks of small sizes for which multi trace matrix model results are recovered in any even dimension In this book the author develops a bijection with stacked two dimensional discrete surfaces for the most general colored building blocks and details how it can be used to classify colored discrete spaces according to their curvature The way in which this combinatorial problem arises in discrete quantum gravity and random tensor models is discussed in detail *The Commercial and Financial Chronicle* ,1926 **Hokkaido**
