The fuel atomizer of a gas turbine engine is a critical component of study design and manufacture for the gas turbine industry Modern engines rely on consistent precise operation of fuel nozzles to achieve today s progressive emission standards and to keep engines operating longer and to keep them overall more competitive The previous research into this field is extensive but has left a gap where relatively computationally simple methods can be used to benefit companies that build aerospace fuel nozzles Through simulation and experimentation the goal of this research was to create a method of modeling aerospace fuel nozzle flow metering valves that is less computationally intense than complex CFD and generates high resolution information for the design and manufacture of said valves A system was developed in MATLAB and Simulink with the intent of matching the valve system and its outputs to an experimental setup This paper primarily evaluates the simulation methods accuracy experimental methods used and the use of cost analysis for optimization Through experimentation and simulation optimization a relatively accurate simulated system is generated that matches valve stroke and flow output relatively well Cost analysis optimization methods failed to establish accurate results and several theories as to why this happened were generated and discussed

Abstract

Fuel Level Control Valves and Systems AE-5A Aerospace Fuel, Inerting and Lubrication Sys Committee,2021

A fuel level control valve system controls the quantity of fuel in a tank being filled or emptied on the aircraft This document provides a general familiarization with these mechanisms e g forms they take functions system design considerations This document provides the aircraft fuel system designer with information about these mechanisms devices so that he can prescribe the types of level control valves systems which are best suited for his particular fuel system configuration The scope has been expanded as different aircraft manufacturers may use different type of fuel system architectures Their refueling and defueling systems may take different configurations may require different types of fuel

control valves and may require different types of interface with the onboard Fuel Measurement System They must also limit pressure surges and be compatible with ground refueling equipment which have varying surge potentials and create surges This revision to the Fuel Level Control Valve System addresses the addition of more valve technologies and the interface of the refuel valves with the refuel system including the Fuel Quantity Indication System *Recommended Practice for Repair, Testing, and Setting Gas Life Valves* American Petroleum Institute,1990 **The Design and Development of Two Check Valves and One Collector Value for Compartmented Aircraft Fuel Tanks ...** Paul Glyn Lucas,1956 **Pressure Testing Probe and Check Valves** ,1967 **Fuel channel check valve development program - slope seal leak tests at 1000 lbf/in2 and room temperature** M. Grimes,GENERAL DYNAMICS/ASTRONAUTICS SAN DIEGO CA.,1960 Pre Production and the Initial Production Evaluation Tests were performed on a vernier fuel check valve The applicable tests in this procedure are as follows Temperature altitude humidity Operating vibration test Life test Proof pressure test Burst pressure test Author *Glovebox Pressure Relief and Check Valve* ,1986 This device is a combined pressure relief valve and check valve providing overpressure protection and preventing back flow into an inert atmosphere enclosure The pressure relief is embodied by a submerged vent line in a mercury reservoir the relief pressure being a function of the submerged depth The pressure relief can be vented into an exhaust system and the relieving pressure is only slightly influenced by the varying pressure in the exhaust system The check valve is embodied by a ball which floats on the mercury column and contacts a seat whenever vacuum exists within the glovebox enclosure Alternatively the check valve is embodied by a vertical column of mercury the maximum back pressure being a function of the height of the column of mercury **Pressure Drop in Globe and Check Valves** Richard Francis Davis,1941 **MA-3 IGNITER FUEL VALVE PURGE CHECK.** P. Shannon,GENERAL DYNAMICS/ASTRONAUTICS SAN DIEGO CA.,1960 During tanking and pre countdown procedure at the 1 4 Test Stand a booster main fuel valve opened flooding the chamber with fuel and necessitating an abort of the count down Among the events leading up to this the igniter purge lines were pressurized to clear moisture out of the hypergol case preparatory to inserting the hypergol cartridge The fuel valve opened when the purge pressure reached approximately 200 psig The objective of the test is to duplicate the conditions that could have existed at 1 4 Stand and observe the results and to evaluate the safety capabilities of the relief action of the igniter valves Author *Pressure Losses in Check Valves Located in a Piston* R. Diagnosis of Electronic Fuel Control (EFC) Valves Via Dynamic Performance Test Method Umut Tugsal, 2009

Electronic Fuel Control EFC valve regulates fuel flow to the injector fuel supply line in the Cummins Pressure Time PT fuel system. The EFC system controls the fuel flow by means of a variable orifice that is electrically actuated. The supplier of the EFC valves inspects all parts before they are sent out. Their inspection test results provide a characteristic curve which shows the relationship between pressure and current provided to the EFC valve. This curve documents the steady state characteristics of the valve but does not adequately capture its dynamic response. A dynamic test procedure is developed in order to evaluate the performance of the EFC valves. The test itself helps to understand the effects that proposed design changes will have on the stability of the overall engine system. A by product of this test is the ability to evaluate returned EFC valves that have experienced stability issues. The test determines whether an EFC valve is faulted or not before it goes out to prime time use. The characteristics of a good valve and bad valve can be observed after the dynamic test. In this thesis a mathematical model has been combined with experimental research to investigate and understand the behavior of the characteristics of different types of EFC valves. The model takes into account the dynamics of the electrical and mechanical portions of the EFC valves. System Identification has been addressed to determine the transfer functions of the different types of EFC valves that were experimented. Methods have been used both in frequency domain as well as time domain. Also based on the characteristic patterns exhibited by the EFC valves fuzzy logic has been implemented for the use of pattern classification.
