Randall,2020-07-30 The results are in observations are not improving teaching and learning Pertinently the Gates Foundation

s recently completed effort to improve student outcomes through enhancing the teacher evaluation process failed to achieve substantive improvement The way observations are currently designed serve as an obstacle to teacher risk taking Teachers fear negative evaluations when their pedagogy is rated and they lack faith in being supported by supervisors because a trusting relationship between them and their observer has not been built Trust Based Observations Maximizing Teaching and Learning Growth is a schema changing evaluation model that understands people perform at their best when they feel safe and supported It begins with twelve 20 minute observations per week followed by collegial conversations driven by reflective questions sharing observed teaching strengths and the building of safe and trusting relationships with teachers Add the elimination of rating pedagogical skills and replace it with rating mindset and teachers trust When teachers fully embrace risk taking and innovation it leads to remarkable teaching transformations and improved student learning **The Vegan**

*why unraveling ion channel multi-protein signaling nexuses is critical for understanding the function of the nervous system* Leigh Anne Swayne, Christophe Altier, Gerald W. Zamponi, 2015-04-15 In the search for simple explanations of the natural world its complicated textures are often filed down to a smoothened surface of our liking The impetus for this Research Topic was borne out of a need to re ignite interest in the complex in this case in the context of ion channels in the nervous system Ion channels are the large proteins that form regulated pores in the membranes of cells and in the brain are essential for the transfer processing and storage of information These pores full of twists and turns themselves are not just barren bridges into cells More and more we are beginning to understand that ion channels are like bustling medieval bridges packed with apartments and shops rather than the more sleek modern variety they are dynamic hubs connected with many structures facilitating associated activities Our understanding of these networks continues to expand as our investigative tools advance Together these articles highlight how the complexity of ion channel signaling nexuses is critical to the proper functioning of the nervous system The long and short of mental time travel-- self-projection over time-scales large and small James M.

Broadway, Claire M. Zedelius, Jonathan W. Schooler, Simon Grondin, 2015-07-02 Researchers working in many fields of psychology and neuroscience are interested in the temporal structure of experience as well as the experience of time at

scales of a few milliseconds up to a few seconds as well as days months years and beyond This Research Topic supposes that broadly speaking the field of time psychology can be organized by distinguishing between perceptual and conceptual time scales Dealing with conceptual time mental time travel also called mental simulation self projection episodic semantic memory prospection foresight allows humans and perhaps other animals to imagine and plan events and experiences in their personal futures based in large part on memories of their personal pasts as well as general knowledge Moreover contents of human language and thought are fundamentally organized by a temporal dimension enmeshed with it so thoroughly that it is usually expressible only through spatial metaphors But what might such notions have to do with experienced durations of events lasting milliseconds up to a few seconds during the so called present moment of perception action cycle time This Research Topic is organized around the general premise that by considering how mental time travel might scale down to time perception and vice versa no less progress and integrative synthesis within and across scientific domains might be facilitated Bipolar configurations of future and past orientations of the self may be repeated in parallel across conceptual and perceptual time scales subsumed by a general Janus like feedforward feedback system for goal pursuit As an example it is notable that the duality of prospection and semantic episodic memory operating at conceptual time scales has an analogue in perception action cycle time namely the interplay of anticipatory attention and working memory Authors from all areas of psychology and neuroscience are encouraged to submit articles of any format accepted by the journal Original Research Methods Hypothesis Theory Reviews etc which might speak to questions about time and temporal phenomena at long and or short time scales *Journal of Developmental Education* ,2015 **Cumulative Author Index to Psychological Abstracts** ,1978 **The New York Times Index** ,2007 *Metals Abstracts* ,1990 *Forthcoming Books* Rose Arny,1997
