Ionic Bonding

Metals and non-metals react together to form _____ compounds. They are held together by ionic bonds. Ionic bonding is a force of _____ attraction between two _____ atoms (called _____). An atom becomes charged by either donating or accepting _____ electrons from another atom. A valence electron is one from the _____ shell of the atom.

Since opposites attract, there is an attraction between the positively charged and negatively charged ions that holds them together.

If an atom _____ an electron, it becomes positively charged. This is then called a _____. _____ always donate electrons. If an atom accepts an electron, it becomes _____. This is called an _____. Non-metals always accept electrons.

Atoms do this in order to become '_____'. A stable atom is one which has obtained a _____ of electrons.

How do we know which atoms donate and which accept electrons?

Sodium has _____ lone electron in the outer shell. It is easiest for this atom to _____ one electron than to try and find seven more to fill the outer shell.

All _____ donate electrons and therefore become cations.

All _____ accept electrons and therefore become anions.

Chlorine has _____ electrons in its outer shell. Therefore, it is easiest for Chlorine to _____ one electron than to _____ to try and donate seven.
