(Chapter – 1) (Sexual Reproduction in Flowering Plants)
(Class – XII)

Answer 4:

An ovule is a female megasporangium where the formation of megaspores takes place.

The various parts of an ovule are –

- **Funiculus** – It is a stalk-like structure which represents the point of attachment of the ovule to the placenta of the ovary.
- **Hilum** – It is the point where the body of the ovule is attached to the funiculus.
- **Integuments** – They are the outer layers surrounding the ovule that provide protection to the developing embryo.
- **Micropyle** – It is a narrow pore formed by the projection of integuments. It marks the point where the pollen tube enters the ovule at the time of fertilization.
- **Nucellus** – It is a mass of the parenchymatous tissue surrounded by the integuments from the outside. The nucellus provides nutrition to the developing embryo. The embryo sac is located inside the nucellus.
- **Chalazal** – It is the based swollen part of the nucellus from where the integuments originate.

Question 5:

What is meant by monosporic development of female gametophyte?

Answer 5:

The female gametophyte or the embryo sac develops from a single functional megaspore. This is known as monosporic development of the female gametophyte. In most flowering plants, a single megaspore mother cell present at the micropylar pole of the nucellus region of the ovule undergoes meiosis to produce four haploid megaspores. Later, out of these four megaspores, only one functional megaspore develops into the female gametophyte, while the remaining three degenerate.

Flourishing Within Limits to Growth Sven Erik Jørgensen, Brian D. Fath, Søren Nors Nielsen, Federico M. Pulselli, Daniel A. Fiscus, Simone Bastianoni, 2015-07-03 Decades of research and discussion have shown that the human population growth and our increased consumption of natural resources cannot continue there are limits to growth This volume demonstrates how we might modify and revise our economic systems using nature as a model The book describes how nature uses three growth forms biomass information and networks resulting in improved overall ecosystem functioning and co development As biomass growth is limited by available resources nature uses the two other growth forms to achieve higher resource use efficiency Through a universal application of the three R s reduce reuse and recycle nature thus shows us a way forward towards better solutions However our current approach dominated by short term economic thinking inhibits full utilization of the three R s and other successful approaches from nature Building on ecological principles the authors present a global model and futures scenario analyses which show that implementation of the proposed changes will lead to a win win situation In other words we can learn from nature how to develop a society that can flourish within the limits to growth with better conditions for prosperity and well being
