**California Energy Demand 2014-2024 Revised Forecast: Statewide electricity demand, end-user natural gas demand, and energy efficiency** Chris Kavalec, 2013 *National Budget Framework Paper for the Financial Years ...*

Uganda, 2015 *Emotion and Aging: Recent Evidence from Brain and Behavior* Natalie Ebner, Håkan Fischer, 2015-05-05 Emotions play a central role in every human life from the moment we are born until we die They prepare the body for action guide decisions and highlight what should be noticed and remembered Since emotions are central to daily functioning and well being it is important to understand the extent to which aging affects the perception of attention to memory for as well as experience and regulation of emotions An early scientific view of how people's emotions are affected by aging argued that aging led to a deterioration of emotional function This theory represented by for example Carl Jung 1875 1961 claimed that old age is a period of life when people feel an increased emotional sameness and less emotional energy According to this scientific view the aging emotional landscape was bleached barren and flattened Current psychological research however shows that emotion is rather a psychological domain that is relatively unaffected by the aging process or even improves with age in contrast to most cognitive functions For example even though there is evidence that aging is associated with deficits in emotion recognition various emotional functions seem to remain intact or become better with age such as the ability to regulate one's emotions or the extent of experiencing positive emotions However more research is needed to determine brain and behavior related quantitative and qualitative age related changes of different aspects of emotion processing and emotional functioning In the current Frontiers research topic we aim to present exciting new findings related to the effects of

healthy aging on both more perceptually driven bottom up as well as more cognitively driven top down aspects of emotions In particular questions such as the following need to be raised and addressed What neural and behavioral processes are underlying age differences in emotion perception and memory for emotional information Are there differences between how older and younger adults experience and regulate their emotions and what drives these differences Is there a gradual reduction or more of a qualitative change of our emotional experiences over the life cycle from the turbulent childhood and youth to the mellower old age And what aspects of age related changes in emotional processing can be explained by age related changes in the brain and which are more affected by other factors such as changes in other body systems in experiential processes or in overall life goals

*Protein Solubility and Aggregation in Bacteria* Salvador Ventura, 2016-09-26

Proteins suffer many conformational changes and interactions through their life from their synthesis at ribosomes to their controlled degradation Only folded and soluble proteins are functional Thus protein folding and solubility are controlled genetically transcriptionally and at the protein sequence level In addition a well conserved cellular machinery assists the folding of polypeptides to avoid misfolding and ensure the attainment of soluble and functional structures When these redundant protective strategies are overcome misfolded proteins are recruited into aggregates Recombinant protein production is an essential tool for the biotechnology industry and also supports expanding areas of basic and biomedical research including structural genomics and proteomics Although bacteria still represent a convenient production system many recombinant polypeptides produced in prokaryotic hosts undergo irregular or incomplete folding processes that usually result in their accumulation as insoluble aggregates narrowing thus the spectrum of protein based drugs that are available in the biotechnology market In fact the solubility of bacterially produced proteins is of major concern in production processes and many orthogonal strategies have been exploited to try to increase soluble protein yields Importantly contrary to the usual assumption that the bacterial aggregates formed during protein production are totally inactive the presence of a fraction of molecules in a native like structure in these assemblies endorse them with a certain degree of biological activity a property that is allowing the use of bacteria as factories to produce new functional materials and catalysts The protein embedded in intracellular bacterial deposits might display different conformations but they are usually enriched in beta sheet rich assemblies resembling the amyloid fibrils characteristic of several human neurodegenerative diseases This makes bacterial cells simple but biologically relevant model systems to address the mechanisms behind amyloid formation and the cellular impact of protein aggregates Interestingly bacteria also exploit the structural principles behind amyloid formation for functional purposes such as adhesion or cytotoxicity In the present research topic we collect papers addressing all the issues mentioned above from both the experimental and computational point of view
