

Questions

- a** The food chain should have a correct sequence of organisms, with one plant and three animals. Arrows should go in the correct direction. For example: fig tree → wasp → spider → lizard.

b Yes, the arrows could also indicate how carbon atoms are transferred. Carbon is contained in the food that animals eat, in the form of compounds such as carbohydrates and proteins.
- Proteins, carbohydrates and fats. Learners could also suggest particular compounds, such as haemoglobin. (Note that animals do not contain starch.)
- There would be no (or very little) combustion of fossil fuels.
- They take a very long time to form. We are using them up much faster than they are being replenished.

Think like a scientist: How do plants and animals affect carbon dioxide concentration?

- Learners will probably find these results:
 Tube A: yellow, high carbon dioxide
 Tube B: purple, no carbon dioxide
 Tube C: yellow, high carbon dioxide
 Tube D: yellow, high carbon dioxide
 Tube E: yellow, high carbon dioxide
 Tube F: red, some carbon dioxide
- Organisms were respiring in all the tubes.
- Plants were photosynthesising in tubes B and F.
- a** Carbon dioxide would be used up in tube B.

b Carbon dioxide would be given out in tubes A, C, D and E.
- Tube A: No photosynthesis because no light; plant respire, giving out carbon dioxide.

Tube B: Plant photosynthesises and respire, but photosynthesises more than it respire; carbon dioxide is used up.

Tube C: Maggots respire, giving out carbon dioxide.

Tube D: Maggots respire, giving out carbon dioxide.

Tube E: No photosynthesis because no light; plant respire, giving out carbon dioxide. Maggots respire, giving out carbon dioxide.

Tube F: Plant photosynthesises and respire, but photosynthesises more than it respire, and therefore uses up carbon dioxide. Maggots respire, giving out carbon dioxide. The two are likely to balance out.

- To make sure that having a platform in place did not cause the differences between the results in the different tubes.

Activity: Modelling the carbon cycle

- No, in the real carbon cycle only some carbon atoms will move at any one point in time. Learners could suggest having only one or two atoms moving on each occasion.
- Learners should find that stopping combustion results in fewer carbon atoms ending up in the air.

Topic 1.4 Climate change

Questions

A 3; B 1; C 3; D2

Questions

- An asteroid is a rock, smaller than a planet, which orbits the Sun.
- It produced a lot of heat, which killed plants and animals close to the collision site.

It produced a huge tsunami, which killed plants and animals on land that were swamped by sea water.

It sent dust high into the atmosphere, so plants died because they could not photosynthesise. Animals then died because there was no food for them to eat.
- 1.3°C
- The temperature fell by 0.3°C between 1880 and 1910. It rose by 1.6°C between 1910 and 2016.
- Multiply the number of years until the end of the century by 3 mm.
- As the mean global temperature increases, more land ice melts and adds extra water to the oceans. Also, higher temperatures cause sea water to expand.

Think like a scientist: How do rising temperatures affect sea level?

- Learners should find that melting ice on land and increasing water temperature both increase the water level. Melting ice in the sea does not increase the water level.
- They indicate how sea level is expected to rise.

Literature Book Grade 9 Answers Yahoo
