on 4-cylinder units), inspect the cylinders visually thru the transfer ports for possible scoring. A more thorough inspection can be made if the heads are removed. It is possible for a cylinder with satisfactory compression to be scored slightly. Also, check the water pump. The overheating condition may be caused by a faulty water pump.

An overheating condition may also be caused by running the engine out of the water. For unknown reasons, many operators have the misconception that running an engine for a short period of time without the lower unit submerged in water, can be done without harm. **FALSE!** Such a practice will result in an overheated condition in a matter of **SECONDS**.

Water must circulate through the lower unit to the engine any time the engine is run to prevent damage to the water pump and an overheating condition. Just five seconds without water will damage the water pump and cause the engine to overheat.

Checking Compression

Remove the spark plug wires. **ALWAYS** grasp the molded cup and pull it loose with a

A compression check should be taken in each cylinder before spending time and money on tune-up work. Without adequate compression, efforts to adjust engine performance will be wasted.
