Agrometeorology J. Seemann,Y. I. Chirkov,J. Lomas,B. Primault,2012-12-06 Agrometeorology is a comparatively young science The beginnings of agrometeorological work came in the 20 s of this century when agrometeorology was a working branch of climatology In the years following 1950 it then developed widely to an independent science In this process agrometeorology has not only gained a vast knowledge of the influence of meteorological conditions on plants and livestock in agriculture and damage prevention but additionally evolved new advisory methods which are of great practical use in agriculture Up to the present time there has been practically no specific training for an agrometeorologist Agrometeorologists are drawn according to their training from the ranks of general meteorology or from agriculture and its related biological disciplines They must therefore themselves gather the knowledge for their agrometeorological work and combine for themselves the complex of agrometeorology from biological and meteorological information This is usually far from easy as the relevant literature is scattered among the most widely differing journals partly in little known foreign languages and is thus very difficult of access Comprehensive writings are to be found only in very few partial fields of agrometeorology The subject of training problems has thus been treated as of utmost importance at the meetings of the Commission for Agrometeorology CAGM of the World Meteorological Organization WMO especially as agrometeorology has won such great significance and usefulness not only in the so called underdeveloped countries in advancing a more productive agriculture but also in countries whose agricultural standard is already high **Mausam** ,2009 **Journal of Ecobiology** ,2003

Plant Ecophysiology: Responses to Climate Changes and Stress Conditions Srdjan Stojnic, Nacer Bellaloui, Raul

Antonio Sperotto, Yanbo Hu, Georgios Koubouris, Peter Petřík, 2025-10-23 Climate change characterized by amplified frequency and amplitude of heat waves increased evaporative demand and altered precipitation patterns threatening the productivity and stability of ecosystems worldwide Previous research identified a number of abiotic and biotic stressors that affects plant physiology and contributes to natural ecosystems decline as well as crop yield failure Depending on their intensity and duration plant species may display a wide range of strategies and mechanisms to withstand environmental stress including physiological and biochemical responses as well as modulation in structural characteristics such as anatomy and morphology However despite the great progress made in understanding plant responses and tolerance to environmental stress factors a holistic and systematic knowledge on the effect of multiple simultaneous and or sequential stress factors and their interactions is still lacking In addition climate change imposes the alteration of a series of environmental factors simultaneously as well as intensify the severity of different stressful events such as drought floods salinity and heat waves Therefore knowledge of how plants acclimate to multiple stressors is critical in understanding the effects of future climates on natural ecosystems urban greenery and agroforestry systems i e tree crops interaction worldwide
