Abstract.

A quadratic function is a function whose rule may be written in the form $f(x) = ax^2 + bx + c$ where a , b , and c are real numbers and a is not zero. The graph of a quadratic function is a parabola which opens up if $a > 0$ and opens down if $a < 0$. Nonetheless, there are many key features in a quadratic graph such as the zeroes (x-intercepts, also known as the roots), y-intercept, axis of symmetry, and the vertex. We will be taking a look at these four features in this presentation. The zeroes, also known as the roots, are the x-intercepts of the parabola. A parabola with its vertex at (h, k) , opening vertically, will have the following properties. The axis of symmetry will have the equation $x = h$. Its form will be $y = a(x - h)^2 + k$. In either case, the vertex is a turning point on the graph. The graph is also symmetric with a vertical line drawn through the vertex, called the axis of symmetry. The y-intercept is the point at which the parabola crosses the y-axis. The x-intercepts are the points at which the parabola crosses the x-axis.
