**Mitosis/Cytokinesis** Arthur Zimmerman,2012-12-02 Mitosis Cytokinesis provides a comprehensive discussion of the various aspects of mitosis and cytokinesis as studied from different points of view by various authors The book summarizes work at different levels of organization including phenomenological molecular genetic and structural levels The book is divided into three sections that cover the premeiotic and premitotic events mitotic mechanisms and approaches to the study of mitosis and mechanisms of cytokinesis The authors used a uniform style in presenting the concepts by including an overview of the field a main theme and a conclusion so that a broad range of biologists could understand the concepts This volume also explores the potential developments in the study of mitosis and cytokinesis providing a background and perspective into research on mitosis and cytokinesis that will be invaluable to scientists and advanced students in cell biology The book is an excellent reference for students lecturers and research professionals in cell biology molecular biology developmental biology genetics biochemistry and physiology

*The Cell in Mitosis* Laurence Levine,2012-12-02 The Cell in Mitosis is a collection of papers presented at the First Annual Symposium held on November 6 8 1961 under the provisions of The Wayne State Fund Research Recognition Award Contributors focus on the complexities posed by the cell in division and consider topics such as the chemical prerequisites for cell division the role of the centriole in division cycles development of the cleavage furrow chemical aspects of the isolated mitotic apparatus histone variability and actin polymerization This volume is organized into 11 chapters and begins with an overview of cell division with reference to the basic essential mechanisms of mitogeneses underlying the emergence of the elegant geometries of mitosis An account of the congression of chromosomes onto metaphase configuration and progression through telophase is also given The next chapters explore the identity and role of the centriole in the whole life cycle of cell behavior the fine structure of animal cells during cytokinesis the mechanism of saltatory particle movements during mitosis and how chemical and physical agents disrupt the mitotic cycle A chapter is devoted to the holotrichous ciliate *Tetrahymena pyriformis* paying attention to its fine structure during mitosis This book will be of interest to physiologists electron microscopists light microscopists biochemists and others who want to know more about the various aspects of cell division

Evert,1998-10-01 [Cell Division: Mitosis and Cytokinesis](#) , An inspiring and challenging 20 minute video for high school or university biology students This video starts by emphasizing the central importance of cells in life and that living cells can only arise from other living cells by cell division After distinguishing mitosis nuclear division from cytokinesis cell division several animal cells are shown undergoing mitosis and a 3D animation shows how the mitotic spindle is assembled

Chromosomes are shown attaching to spindle fibers both in living cells and in a 3D animation All phases of mitosis are shown and discussed in detail Cell division in higher plant cells is similarly illustrated emphasizing the role of the phragmoplast in cell plate cross wall formation Separation of homologous chromatids and single chromatids is shown in living spermatocytes undergoing meiosis I and II respectively The relationship between cell division and morphogenesis is introduced by showing several single celled organisms that differentiate into complex shapes after every division Other types of cells remain together after division to form simple multicellular organisms These two abilities are required for embryogenesis Two examples in frogs and zebrafish show how repeated cycles of cell division and differentiation transform the ball of cells created by these divisions into recognizable embryos
