possibilities are constantly coming into being and have no static characteristics each arises from an event which has produced an opening onto it and its actualization will in turn give rise to other openings In perceiving that a possibility can be realized and in acting upon it the child creates something that did not exist before To observe this process Piaget and his associates devised a series of thirteen problems appropriate for children ranging in age from four or five to eleven or twelve they were asked to name all possible ways three dice might be arranged for example or a square of paper sectioned The experimenters had two primary aims to discover to what extent the child s capacity to see possibilities develops with age and to determine the place in cognitive development of this capacity does it precede or follow the advent of operational thought structures In charting this process Piaget discerns a growing interaction between possibility and necessity How the child comes to understand necessity and achieves a dynamic synthesis or equilibrium between the possible and the necessary is discussed by Piaget and his colleagues in Volume 2 *The Role of Necessity in Cognitive Development* also published by Minnesota
