**Reasoning** Vinod Goel,Gorka Navarrete,Ira A. Noveck,Jérôme Prado,2017-04-03 Despite the centrality of rationality to our identity as a species let alone the scientific endeavour and the fact that it has been studied for several millennia the present state of our knowledge of the mechanisms underlying logical reasoning remains highly fragmented For example a recent review concluded that none of the extant 12 theories provide an adequate account Khemlani Oaksford Over 2009 Over the past 15 years neuroscience brain imaging techniques and patient studies have been used to map out the functional neuroanatomy of reasoning processes The aim of this research topic is to discuss whether this line of research has facilitated hindered or has been largely irrelevant for understanding of reasoning processes The answer is neither obvious nor uncontroversial We would like to engage both the cognitive and the neuroscience community in this discussion Some of the questions of interest are How have the data generated by the patient and neuroimaging studies influenced our thinking about modularity of deductive reasoning impacted the debate between mental logic theory mental model theory and the dual mechanism accounts affected our thinking about dual mechanism theories informed discussion of the relationship between induction and deduction illuminated the relationship between language visual spatial processing and reasoning affected our thinking about the unity of deductive reasoning processes Have any of the cognitive theories of reasoning helped us explain deficits in certain patient populations Do certain theories do a better job of this than others Is there any value to localizing cognitive processes and identifying dissociations for reasoning and other cognitive processes What challenges have
