

SUBTRACTION ON A NUMBER LINE

When subtracting on a number line, start on the **larger number** and **draw hops backward** to represent the **smaller number**.

$$14 - 5 =$$

The **difference** is the number you land on!

Number lines do not have to start at 0.

You can make a number line with your **biggest number** at the end and **count back** to subtract!

$$9 - 3 = 6$$

Samuel Judah Sober, 2005 The brain's success in perceiving and interacting with the world depends on its ability to assimilate multiple streams of sensory information One particularly important sensory integration problem concerns the use of sensory feedback from the body to plan and execute arm movements Information about arm position is available to both vision and proprioception and these signals must be integrated in order to plan accurate reaches Although both modalities can encode arm position the question of how the brain weights these signals has not been systematically investigated To address this issue we developed a psychophysical technique for quantifying the relative reliance on vision versus proprioception during reach planning Subjects planned and executed reaching movements while receiving virtual visual feedback By analyzing the reaching errors that resulted from shifting the visual feedback away from the true hand position we measured sensory integration at two different stages of reach planning As described in Chapter 1 we found that the first planning stage relies mostly on visual information whereas the second stage relies more on proprioceptive signals This difference suggests that the planning computations performed at each stage inform the selection of sensory input This hypothesis is further supported by the results presented in Chapter 2 in which we show that altering the details of the sensorimotor task drives changes in sensory integration In Chapter 3 we explore the consequences of sensorimotor adaptation on sensory integration and show that the effects of learning can drive changes at a single stage of reach planning Lastly Chapter 4 presents a set of hypotheses about where and how the two planning stages might be implemented in the primate brain and suggests a series of experiments designed to confirm the computational role of single neurons Mathematics for Elementary School Teachers Tom Bassarear, 2004-03-01 Mathematics for Elementary School Teachers 3 e offers pre service teachers a comprehensive mathematics course designed to foster concept development through examples investigations and explorations Visual icons throughout the main text allow instructors to easily connect the text to the hands on activities in the corresponding Explorations Manual Classroom Connections in both the exposition and the exercises guide students to connect the mathematics being taught with effective teaching strategies Students must analyze educational mathematics research evaluate common student errors and see alternative solution methods enabling them to better prepare for their future teaching careers Investigations encourage students to think about a topic before discussing the math or viewing examples These can be used as classroom discussion questions for independent reading or as review Multiple Strategies
