## **Mr Spectroscopy Of Pediatric Brain Disorders:**

MR Spectroscopy of Pediatric Brain Disorders Stefan Blüml, Ashok Panigrahy, 2012-12-02 Magnetic resonance spectroscopy MRS is a modality available on most clinical MR scanners and readily integrated with standard MR imaging MRI For the brain in particular MRS has been a powerful research tool providing additional clinically relevant information for several disease families such as brain tumors metabolic disorders and systemic diseases The most widely available MRS method proton <sup>1</sup>H hydrogen spectroscopy is FDA approved for general use in the US and can be ordered by clinicians for patient studies if indicated There are several books available that describe applications of MRS in adults However to the best of our knowledge there is currently no book available that focuses exclusively on applications in pediatrics MR spectroscopy in the pediatric population is different from adults for two main reasons Particularly in the newborn phase the brain undergoes biochemical maturation with dramatic changes of the normal biochemical fingerprint Secondly brain diseases in the pediatric population are different from adult disorders For example brain tumors which are mostly gliomas in the adults often originate from different cell types and are also more diverse even within the same type and grade of tumor This diversity of diseases and its implications for MR spectroscopy has not been addressed sufficiently in the literature we believe The target audience for MR Spectroscopy of Pediatric Brain Disorders are thus both clinicians and researchers involved with pediatric brain disorders This includes radiologists neurologists neurooncologists neurosurgeons and more broadly the neuroscience and neurobiology community This book will provide the necessary background information to understand the basics of MR spectroscopy This will be followed by a detailed discussion of the normal biochemical maturation which will highlight the metabolic differences between the pediatric and adult brain Thereafter in SECTION I individual chapters will address various pediatric brain disease families Of particular importance for pediatrics are case studies For that reason SECTION II will contain a large number of case studies This will be particularly important for clinicians who may want to see examples of MRS for various conditions A standardized format will be used for case reports that allow the reader to quickly understand the history of each case presented and the significance of the findings The case reports will also include information from other imaging modalities to point out any added value of MRS in addition to conventional studies and clinical information This section is necessary because the format of providing more complete information about individual patients is not practical for the chapters in SECTION I

**MRI of the Pediatric Brain** R. Nuri Sener, 2003-01-01 As medical imaging techniques have improved both in variety and precision medical imaging has assumed an increasingly significant part in the clinical care of patients It plays a major role in narrowing differential diagnoses directing specific therapies and in non invasively reanalysing the patient both while undergoing therapy and after the treatment is completed This is particularly important in the diagnosis and treatment of brain dysfunction or injury in children In terms of brain function as with almost everything else children are not merely small adults They can have unique medical problems that differ in ways that are sometimes profound sometimes subtle from the problems of adults While symptoms and clinical historical information are vital diagnostic tools they are not always sufficient to allow a specific diagnosis to be made with confidence Therefore medical imaging has assumed a greater role in early diagnosis and treatment In treating any group of patients it is important to have a comprehensive understanding of both normal and pathological anatomy This book adds to our understanding of both these aspects of the paediatric brain and will be an extremely useful reference for the clinician to diagnose prognoses and prescribe optimal treatment for this specialised group of patients
