Lay, 2011-11-21

Linear algebra is relatively easy for students during the early stages of the course when the material is presented in a familiar concrete setting But when abstract concepts are introduced students often hit a brick wall Instructors seem to agree that certain concepts such as linear independence spanning subspace vector space and linear transformations are not easily understood and require time to assimilate Since they are fundamental to the study of linear algebra students understanding of these concepts is vital to their mastery of the subject David Lay introduces these concepts early in a familiar concrete \mathbb{R}^n setting develops them gradually and returns to them again and again throughout the text so that when discussed in the abstract these concepts are more accessible Note This is the standalone book if you want the book access card order the ISBN below 0321399145 9780321399144 Linear Algebra plus MyMathLab Getting Started Kit for Linear Algebra and Its Applications Package consists of 0321385179 9780321385178 Linear Algebra and Its Applications 0321431308 9780321431301 MyMathLab MyStatLab Glue in Access Card 0321654064 9780321654069 MyMathLab Inside Star Sticker

Linear Algebra Done Right Sheldon

Axler, 2023-10-28 Now available in Open Access this best selling textbook for a second course in linear algebra is aimed at undergraduate math majors and graduate students The fourth edition gives an expanded treatment of the singular value decomposition and its consequences It includes a new chapter on multilinear algebra treating bilinear forms quadratic forms tensor products and an approach to determinants via alternating multilinear forms This new edition also increases the use of the minimal polynomial to provide cleaner proofs of multiple results Also over 250 new exercises have been added The novel approach taken here banishes determinants to the end of the book The text focuses on the central goal of linear algebra understanding the structure of linear operators on finite dimensional vector spaces The author has taken unusual care to motivate concepts and simplify proofs A variety of interesting exercises in each chapter helps students understand and manipulate the objects of linear algebra Beautiful formatting creates pages with an unusually student friendly appearance in both print and electronic versions No prerequisites are assumed other than the usual demand for suitable mathematical maturity The text starts by discussing vector spaces linear independence span basis and dimension The book then deals with linear maps eigenvalues and eigenvectors Inner product spaces are introduced leading to the finite dimensional spectral theorem and its consequences Generalized eigenvectors are then used to provide insight into the structure of a linear operator From the reviews of previous editions Altogether the text is a didactic masterpiece zbMATH The determinant free proofs are elegant and intuitive American Mathematical Monthly The most original linear algebra book to appear in years it certainly belongs in every undergraduate library CHOICE

Categories for the Working Mathematician Saunders Mac

Lane, 1998-09-25 Categories for the Working Mathematician provides an array of general ideas useful in a wide variety of fields Starting from the foundations this book illuminates the concepts of category functor natural transformation and duality The book then turns to adjoint functors which provide a description of universal constructions an analysis of the representations of functors by sets of morphisms and a means of manipulating direct and inverse limits These categorical concepts are extensively illustrated in the remaining chapters which include many applications of the basic existence theorem for adjoint functors The categories of algebraic systems are constructed from certain adjoint like data and characterized by Beck's theorem After considering a variety of applications the book continues with the construction and exploitation of Kan extensions This second edition includes a number of revisions and additions including two new chapters on topics of active interest One is on symmetric monoidal categories and braided monoidal categories and the coherence theorems for them The second describes 2 categories and the higher dimensional categories which have recently come into prominence The bibliography has also been expanded to cover some of the many other recent advances concerning categories

Introduction to Coding Theory J.H. van Lint, 1998-12-15 It is gratifying that this textbook is still sufficiently popular to warrant a third edition I have used the opportunity to improve and enlarge the book When the second edition was

prepared only two pages on algebraic geometry codes were added. These have now been removed and replaced by a relatively long chapter on this subject. Although it is still only an introduction, the chapter requires more mathematical background of the reader than the remainder of this book. One of the very interesting recent developments concerns binary codes defined by using codes over the alphabet \mathbb{F}_4 . There is so much interest in this area that a chapter on the essentials was added. Knowledge of this chapter will allow the reader to study recent literature on \mathbb{F}_4 codes. Furthermore, some material has been added that appeared in my Springer Lecture Notes [201] but was not included in earlier editions of this book, e.g. Generalized Reed Solomon Codes and Generalized Reed Muller Codes. In Chapter 2, a section on Coding Gain, the engineer's justification for using error correcting codes, was added. For the author preparing this third edition, it was a most welcome return to mathematics after seven years of administration. For valuable discussions on the new material, I thank C. P. I. M. Baggen, I. M. Duursma, H. D. L. Hollmann, H. C. A. van Tilborg, and R. M. Wilson. A special word of thanks to R. A. Pellikaan for his assistance with Chapter 10.

Linear Algebra and Its Applications (fourth Edition) David C. Lay, 2018

Numerical Analysis for Science, Engineering and Technology Said Gamil Ahmed, Hossein Jafari, Mukhtar Yagoub Youssif, Roberto Datja, 2018-05-02. This textbook is intended as a guide for undergraduate and graduate students in engineering science and technology courses. Chapters of the book cover the numerical concepts of errors, approximations, differential equations, and partial differential equations. The simple presentation of numerical concepts and illustrative examples helps students and general readers to understand the topics covered in the text.

Probability Theory II M. Loeve, 1978-05-15. This book is intended as a text for graduate students and as a reference for workers in probability and statistics. The prerequisite is honest calculus. The material covered in Parts Two to Five inclusive requires about three to four semesters of graduate study. The introductory part may serve as a text for an undergraduate course in elementary probability theory. Numerous historical marks about results, methods, and the evolution of various fields are an intrinsic part of the text. About a third of the second volume is devoted to conditioning and properties of sequences of various types of dependence. The other two thirds are devoted to random functions; the last Part on Elements of random analysis is more sophisticated.

A Course in Computational Algebraic Number Theory Henri Cohen, 2000-08-01. A description of 148 algorithms fundamental to number theoretic computations, in particular for computations related to algebraic number theory, elliptic curves, primality testing, and factoring. The first seven chapters guide readers to the heart of current research in computational algebraic number theory, including recent algorithms for computing class groups and units, as well as elliptic curve computations, while the last three chapters survey factoring and primality testing methods, including a detailed description of the number field sieve algorithm. The whole is rounded off with a description of available computer packages and some useful tables backed by numerous exercises. Written by an authority in the field and one with great practical and teaching experience, this is certain to become the standard and indispensable reference on the subject.
